

# Computational Wiretap Coding from Indistinguishability Obfuscation

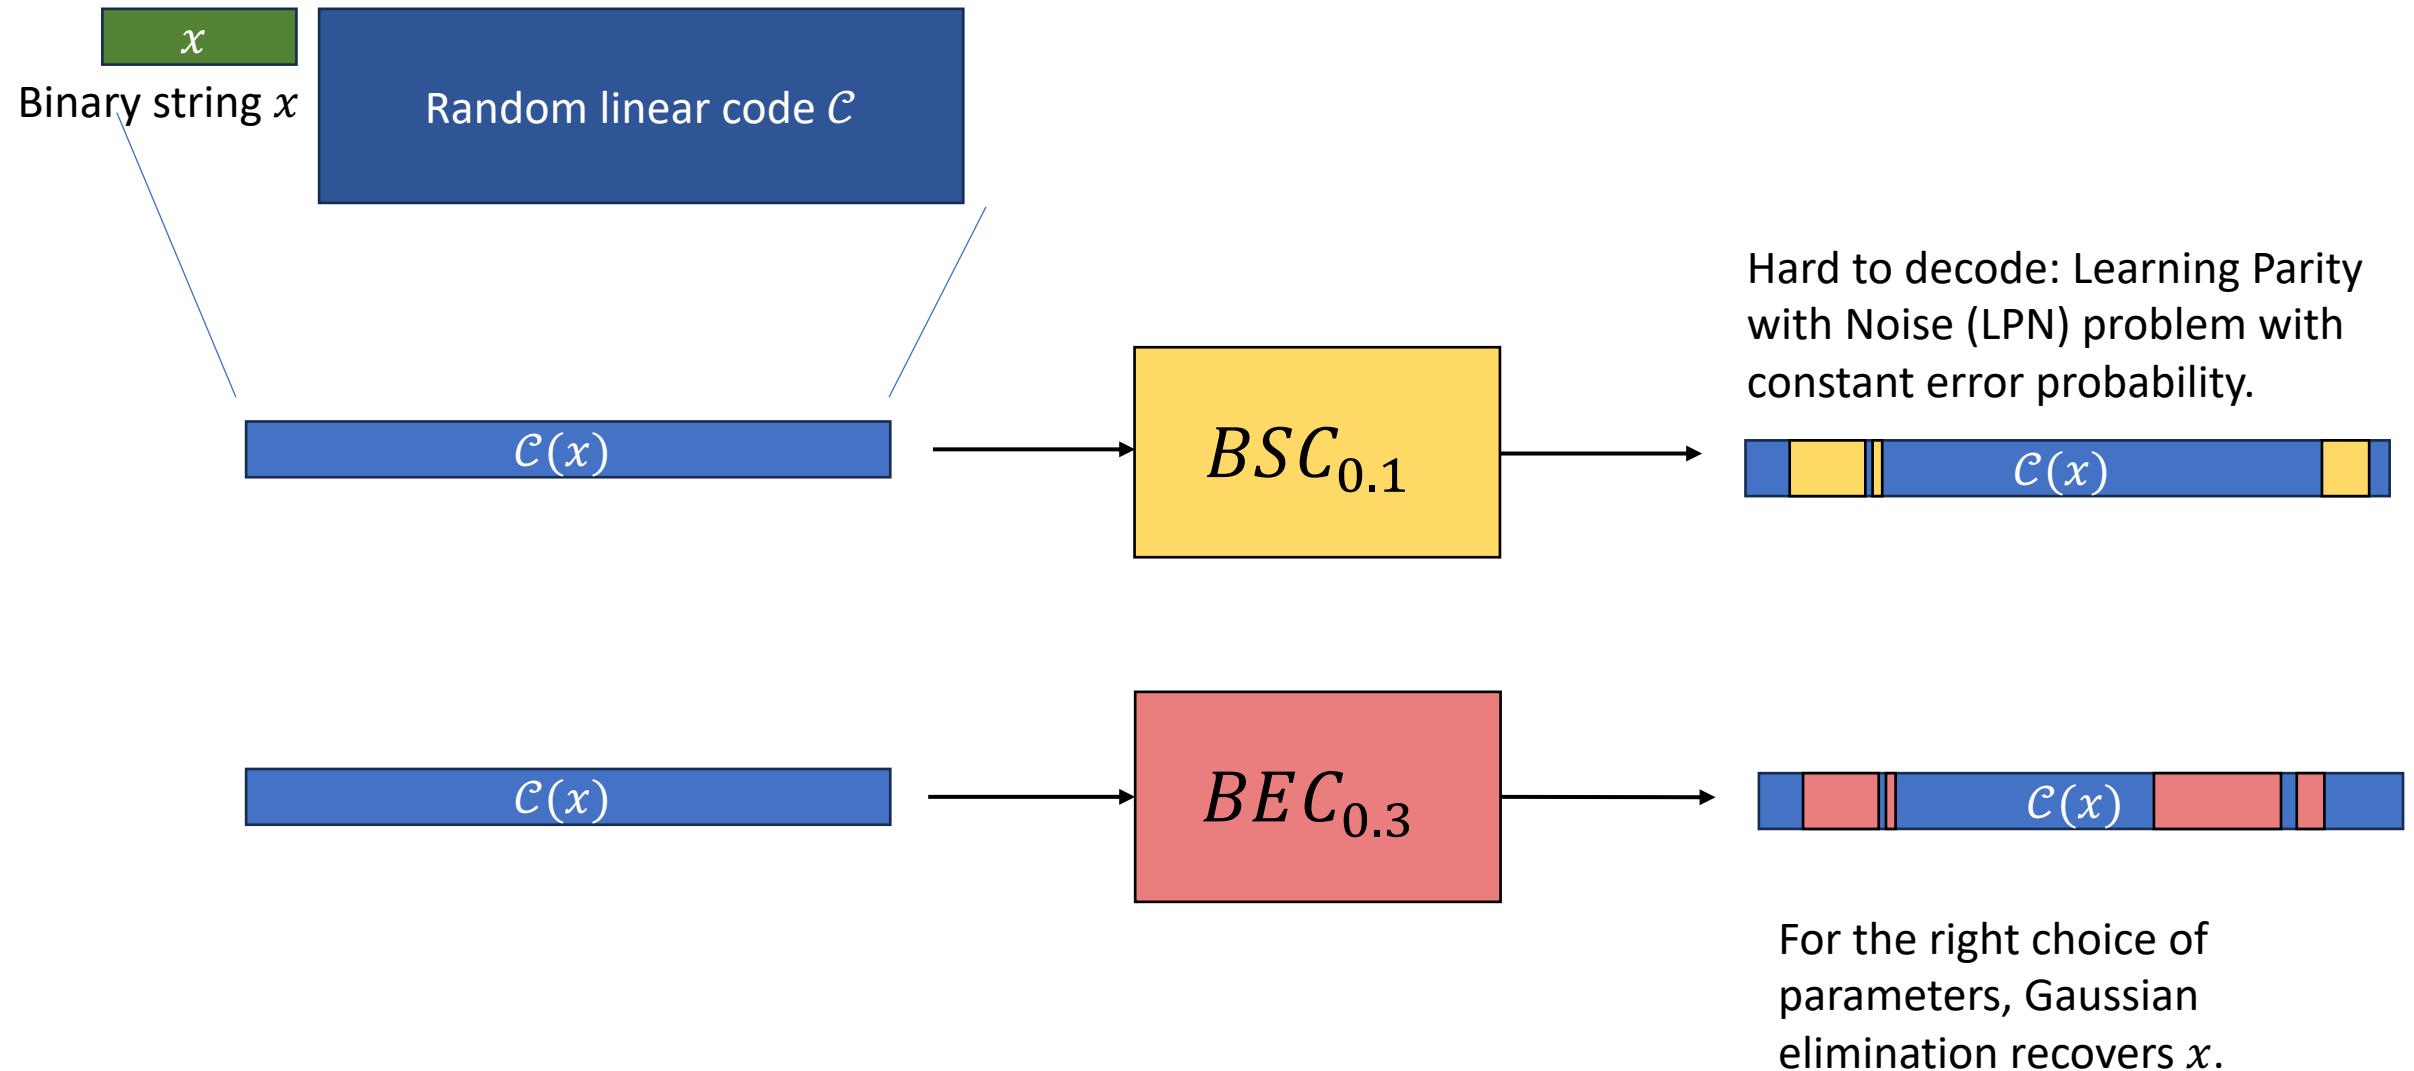

Yuval Ishai (Technion), Aayush Jain (CMU), Paul Lou (UCLA),  
Amit Sahai (UCLA), Mark Zhandry (NTT Research)

Teaser: Interesting special case of  
the general wiretap problem

# Teaser: Curious Coding Theory Question

# Teaser: Curious Coding Theory Question

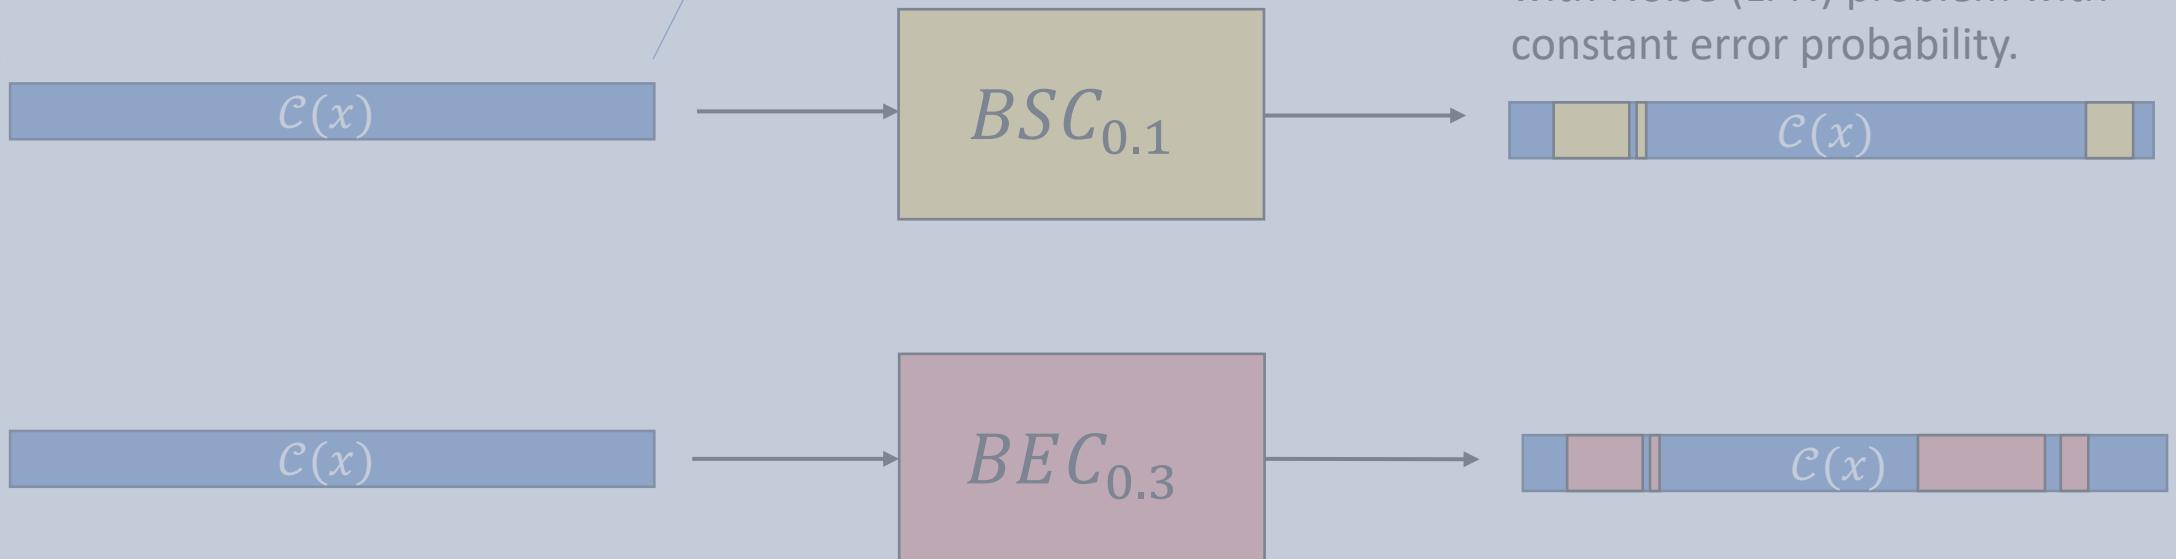

# Teaser: Curious Coding Theory Question

Do there exist error-correcting codes that satisfy the following?

1. Easy to decode from 0.1 bitflip error rate. [LDPC, BCH, etc.]
2. Computationally hard to decode from 0.3 erasure rate. [Linear codes fail]

Binary strings

Hard to decode: Learning Parity with Noise (LPN) problem with constant error probability.

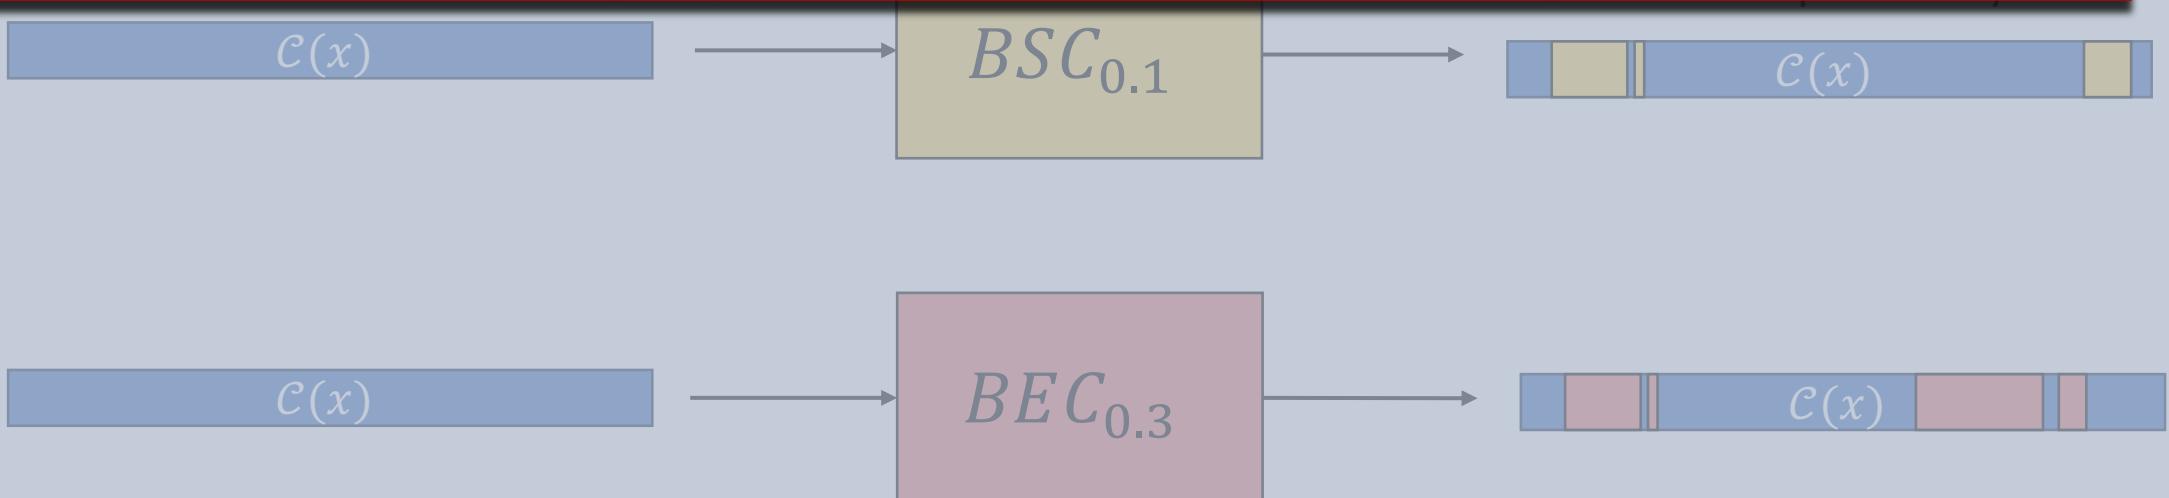

For the right choice of parameters, Gaussian elimination recovers  $x$ .

# Teaser: Curious Coding Theory Question

Do there exist error-correcting codes that satisfy the following?

1. Easy to decode from 0.1 bitflip error rate. [LDPC, BCH, etc.]
2. Computationally hard to decode from 0.3 erasure rate. [Linear codes fail]

Until last year, no such codes known to satisfy both.

For the right choice of parameters, Gaussian elimination recovers  $x$ .

This Work: Yes\*, assuming standard hardness assumptions!

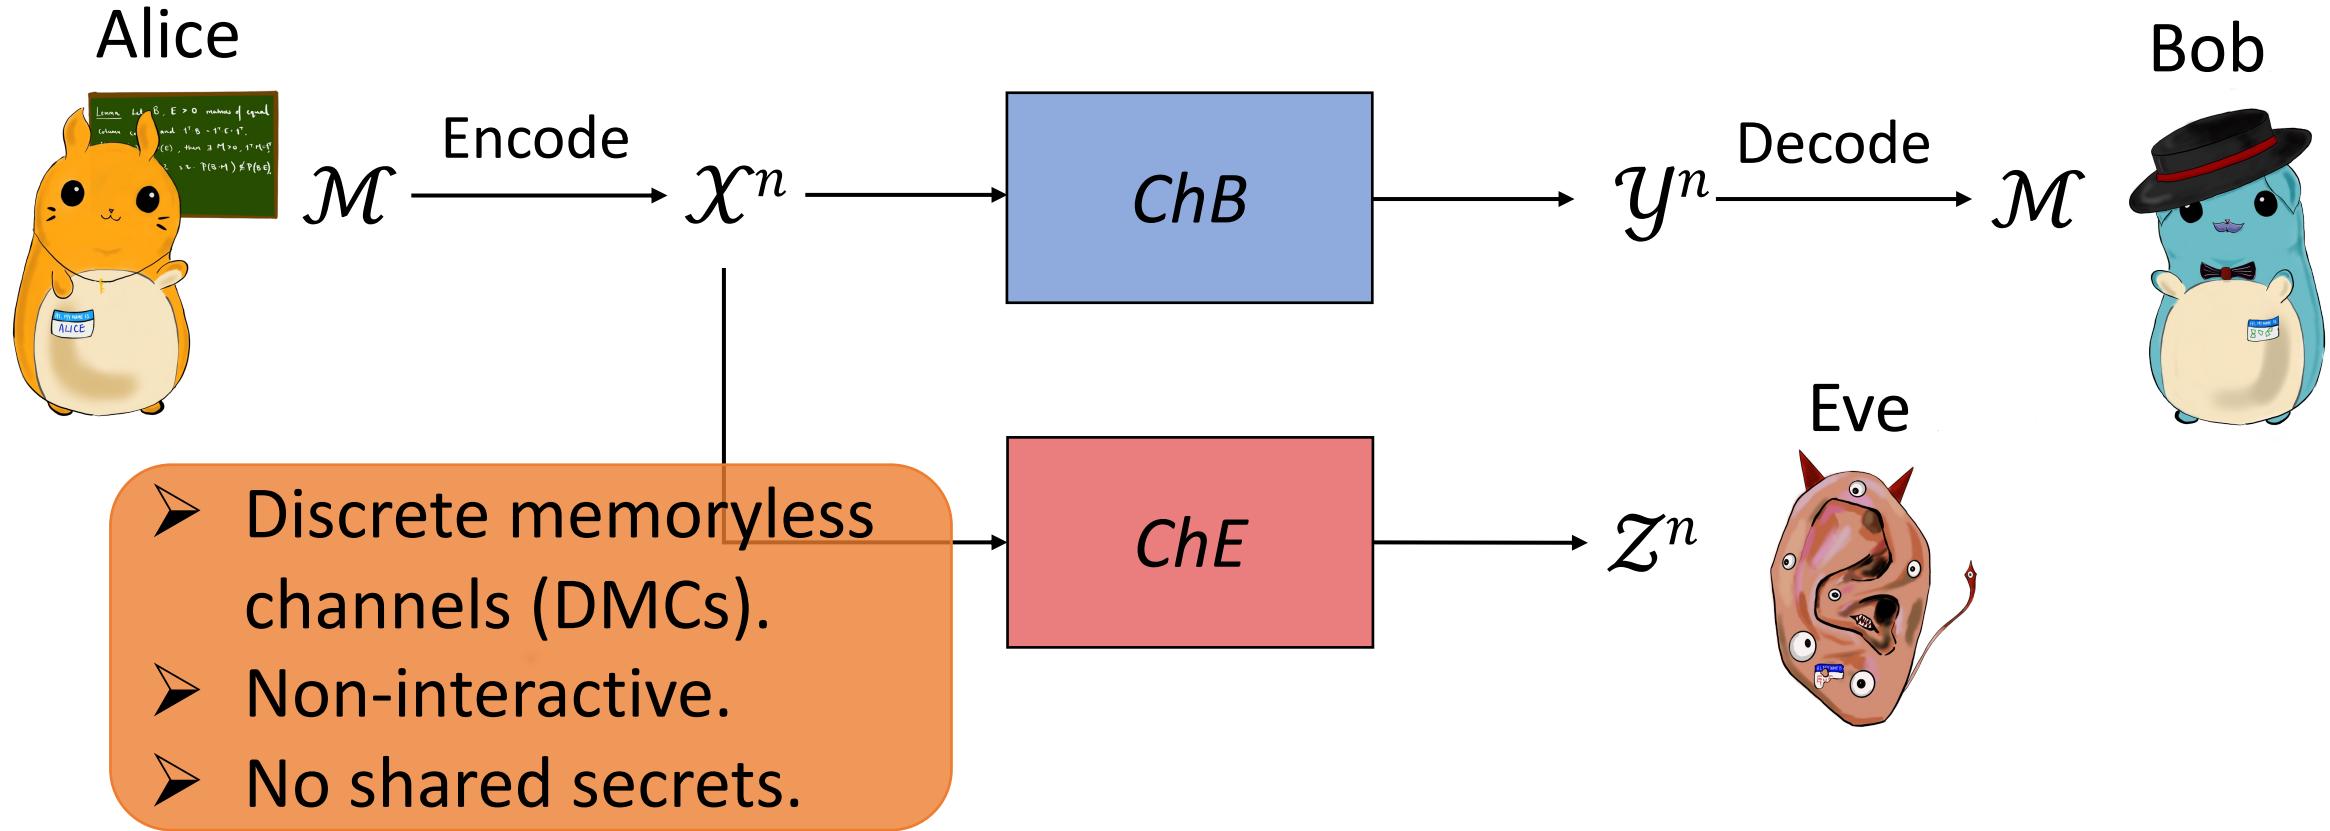

For the right choice of parameters, Gaussian elimination recovers  $x$ .

# General Setting: Wiretap Channel [Wyn75]

**Goal:** Alice wants to send a message to Bob without Eve learning it.

# More General Setting: Wiretap Channel [Wyn75]

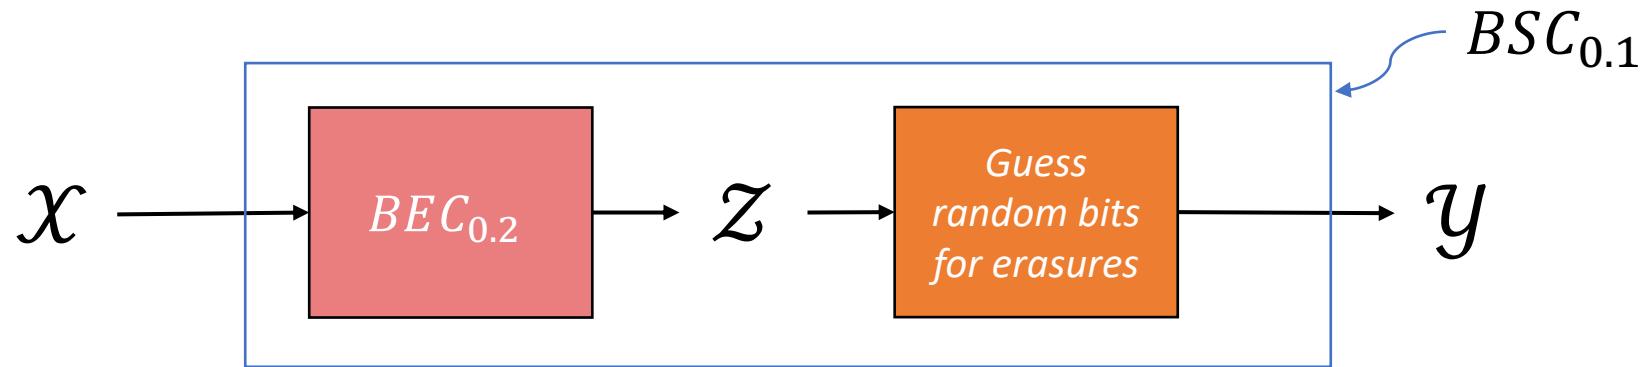

**Goal:** Alice wants to send a message to Bob without Eve learning it.

For what pairs of channels do  
wiretap coding schemes exist?

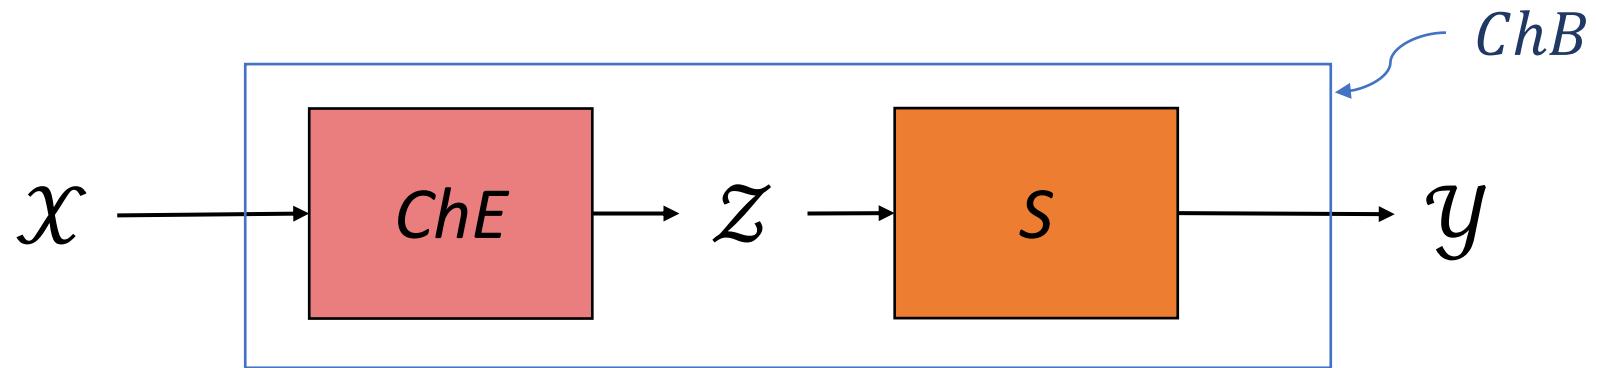

# Intuitive Impossibility for Degraded Pairs

**Impossible** for channel pair  $(BSC_{0.1}, BEC_{0.2})$ . Eve can perfectly simulate  $BSC_{0.1}$ 's output distribution using an output of  $BEC_{0.2}$ .

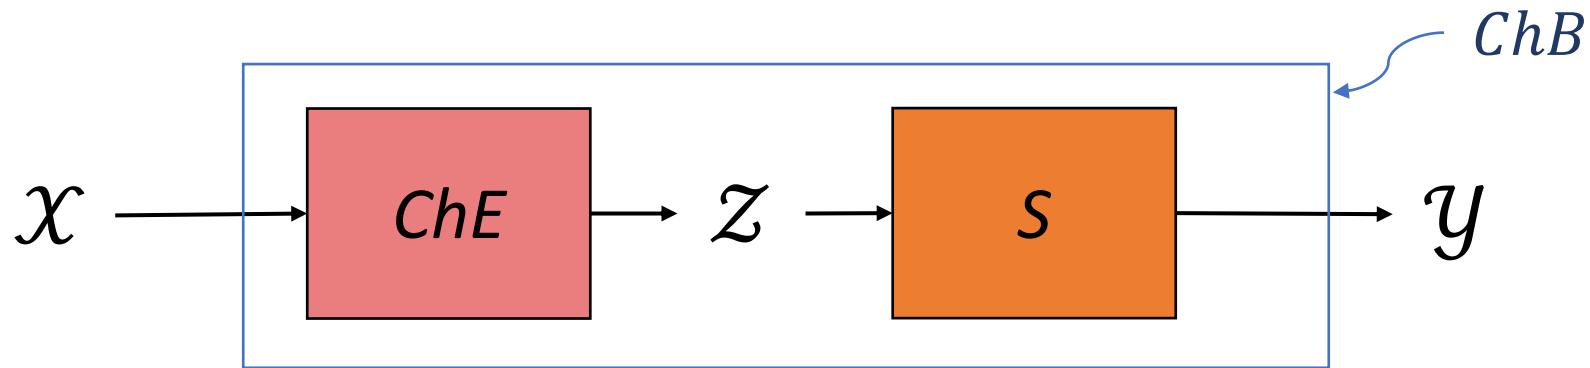

# Intuitive Impossibility for Degraded Pairs

**Impossible** for any channel pair  $(ChB, ChE)$  where Eve can perfectly simulate  $ChB$ 's output distribution using an output of  $ChE$ .

# Intuitive Impossibility for Degraded Pairs

**Impossible** for any channel pair  $(ChB, ChE)$  where Eve can perfectly simulate  $ChB$ 's output distribution using an output of  $ChE$ .

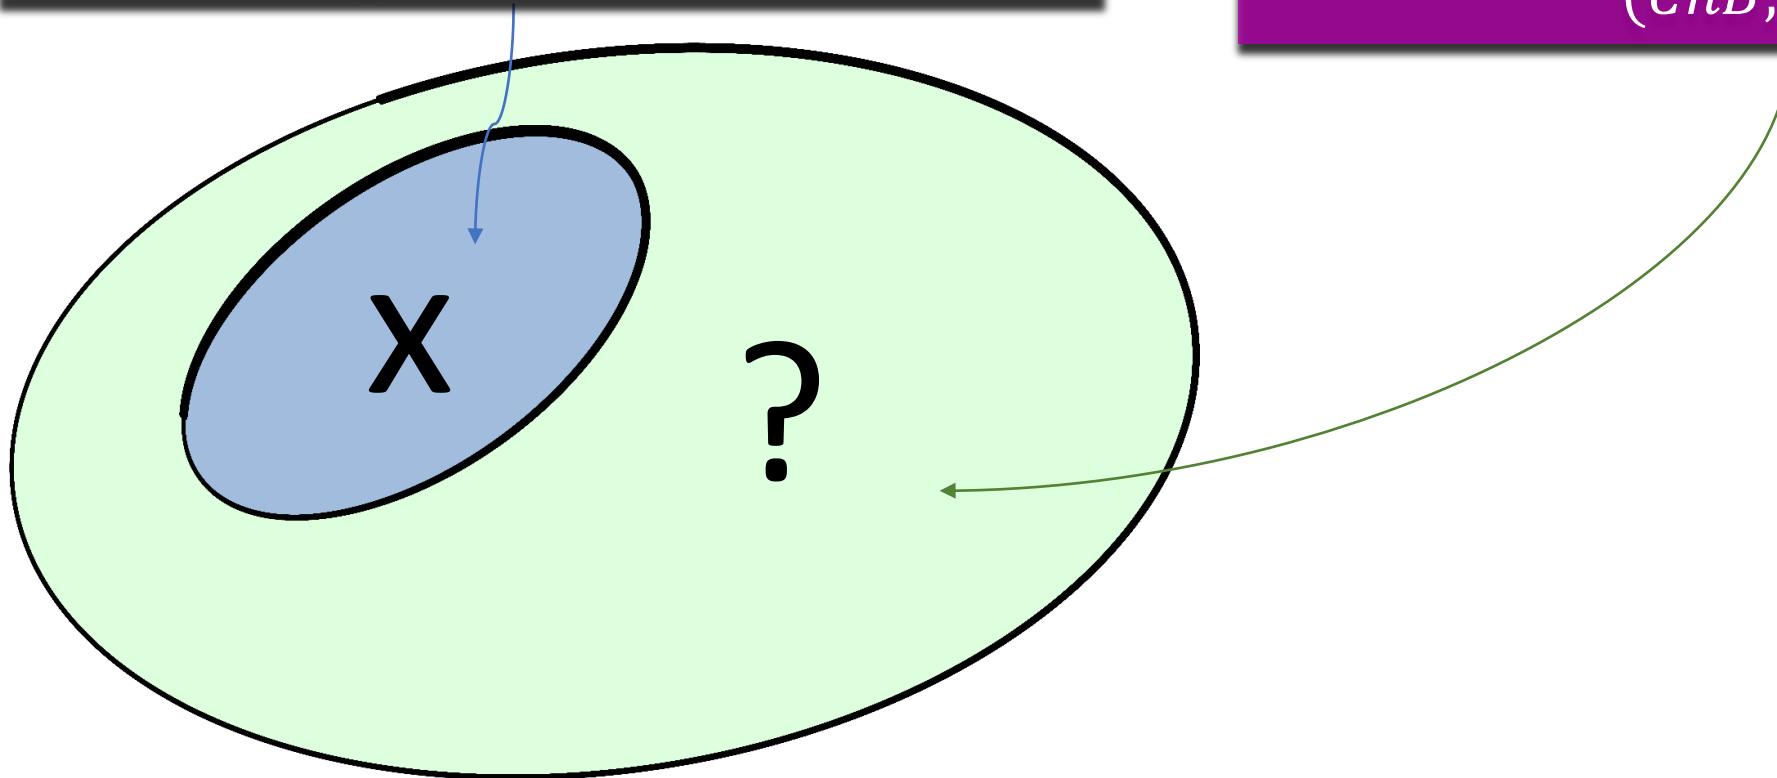

**Degradation:**  $ChB$  is a degradation of  $ChE$  if and only if Eve can perfectly simulate  $ChB$  using  $ChE$ .

# Existence of Wiretap Coding Schemes

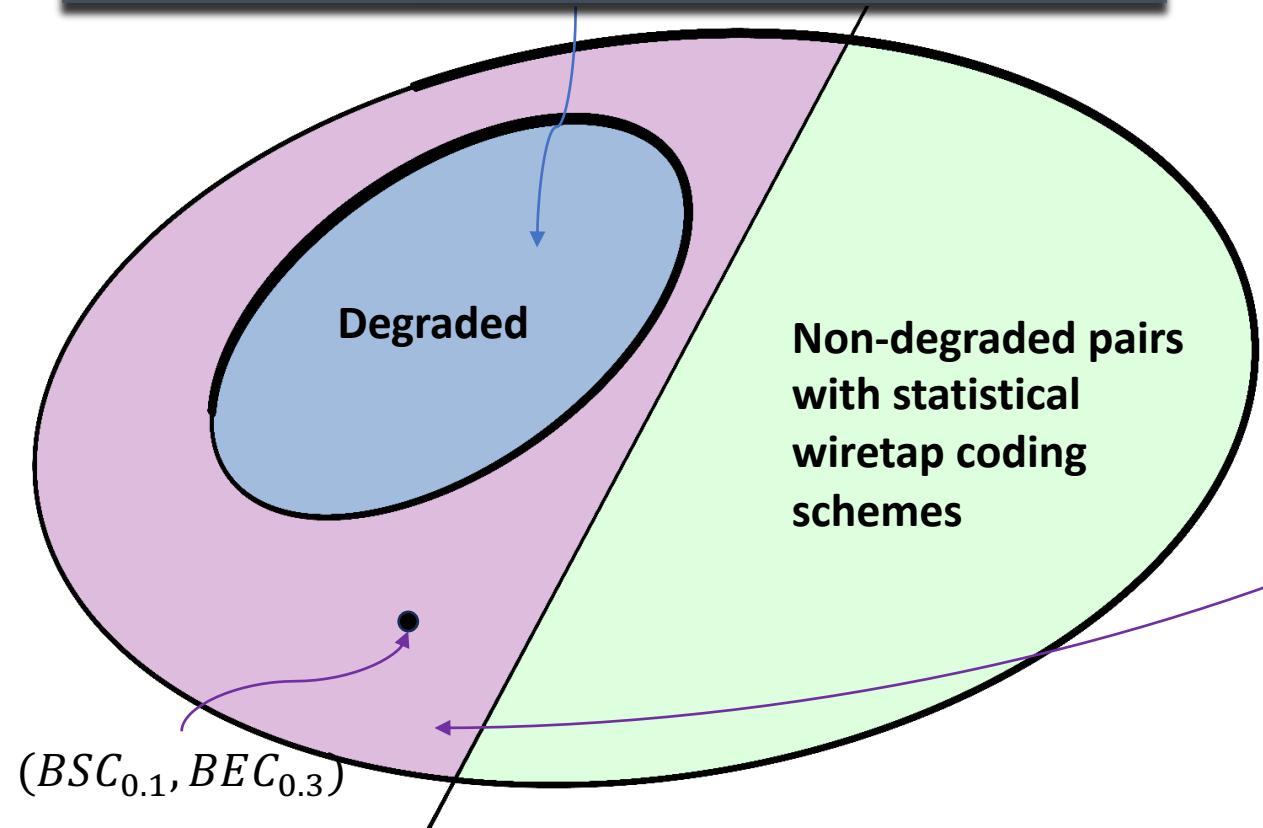

None for  $(ChB, ChE)$  where  $ChB$  is a degradation of  $ChE$ .

Do there exist wiretap coding schemes for non-degraded channel pairs  $(ChB, ChE)$ ?

# Existence of Wiretap Coding Schemes

None for  $(ChB, ChE)$  where  $ChB$  is a degradation of  $ChE$ .

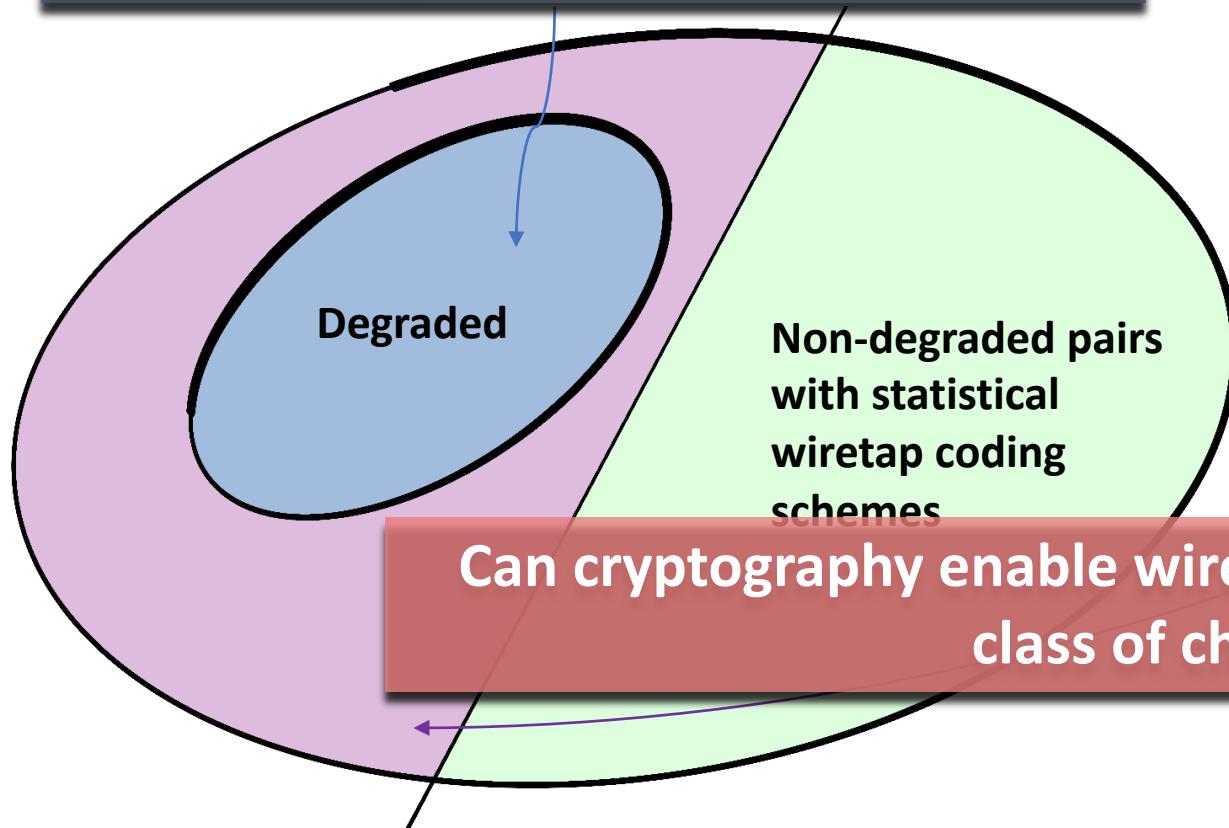

Csiszár, Korner '78: There are non-degraded channel pairs that do not have statistical wiretap coding schemes.

# Existence of Wiretap Coding Schemes

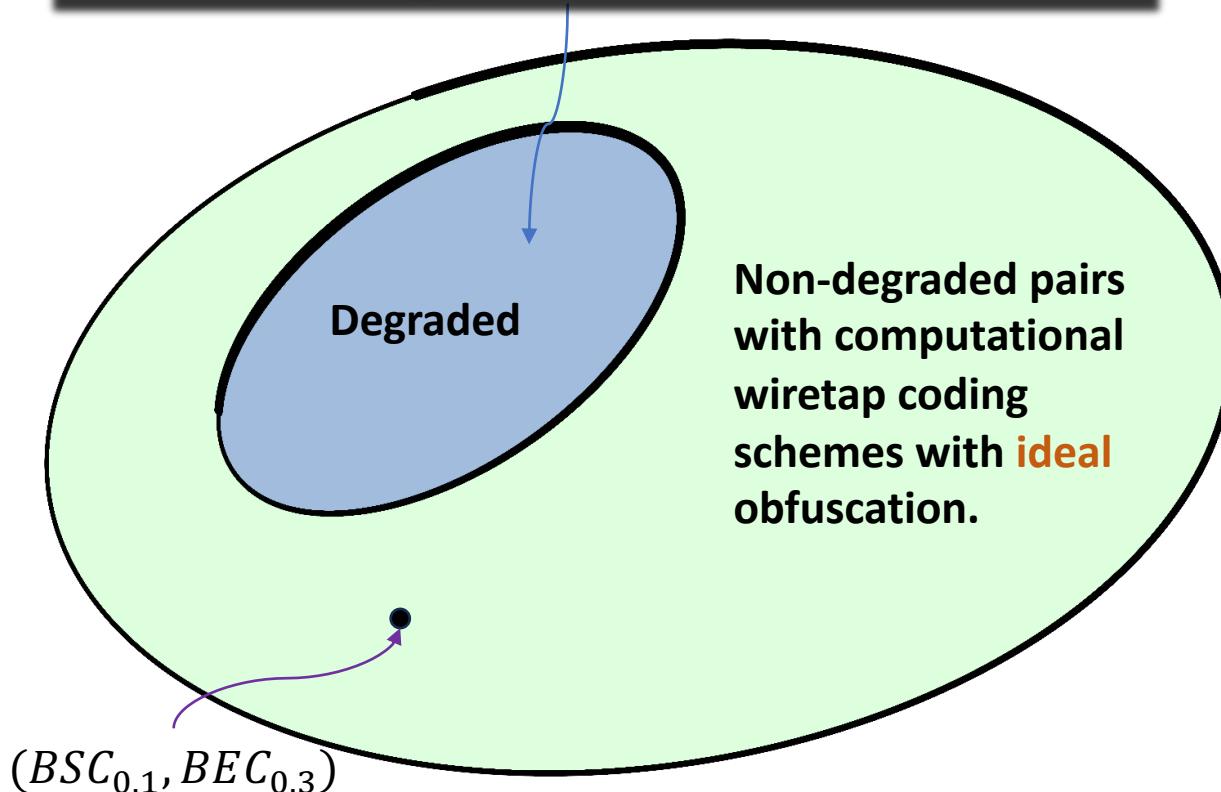

None for  $(ChB, ChE)$  where  $ChB$  is a degradation of  $ChE$ .

Csiszár, Korner '78: There are non-degraded channel pairs that do not have statistical wiretap coding schemes.

# Existence of Wiretap Coding Schemes

None for  $(ChB, ChE)$  where  $ChB$  is a degradation of  $ChE$ .

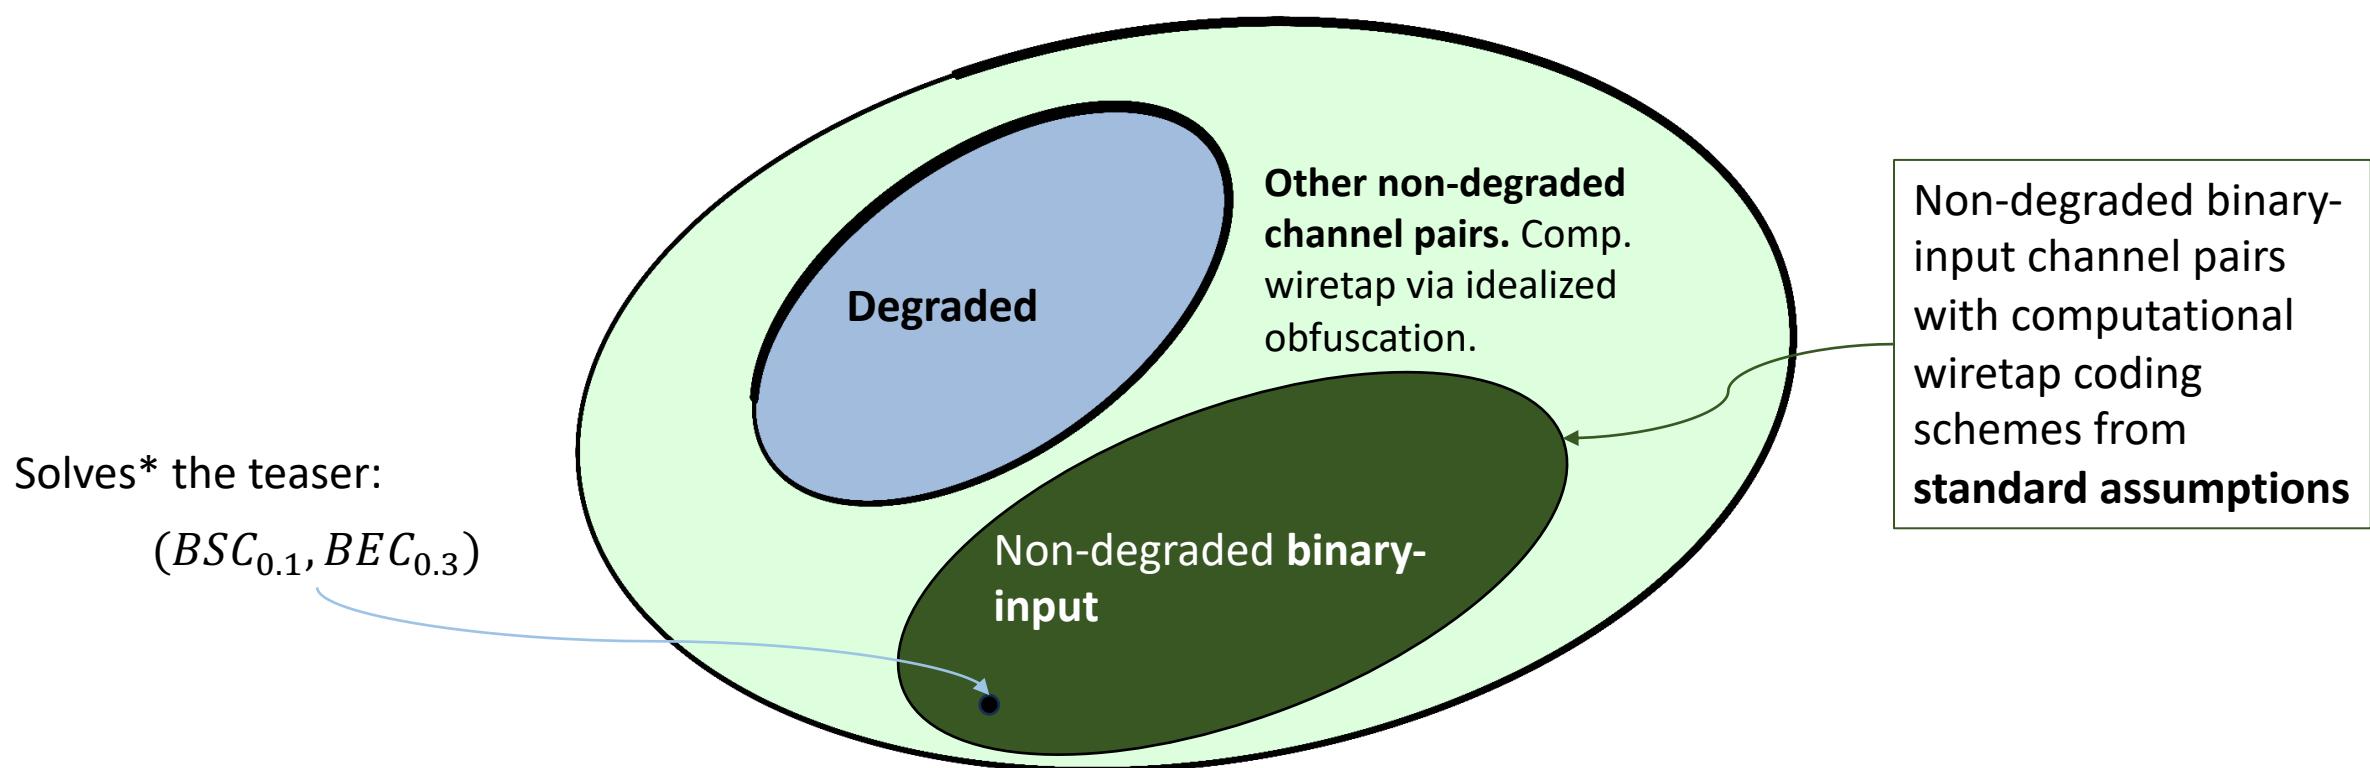

Csiszár, Korner '78: There are non-degraded channel pairs that do not have statistical wiretap coding schemes.

Ishai, Korb, Lou, Sahai '22: There exists a computational wiretap coding scheme for all non-degraded channel pairs in **the Ideal Obfuscation Model (or non-std. VBB obfuscation)**.

Can we obtain computational  
wiretap coding schemes from  
standard assumptions?

# Our Main Result: YES

**Theorem:** Assuming the existence of indistinguishability obfuscation (*iO*) and injective PRGs, there exists a computational wiretap coding scheme for any pair of non-degraded **binary-input** channels ( $ChB, ChE$ ).

# Our Techniques

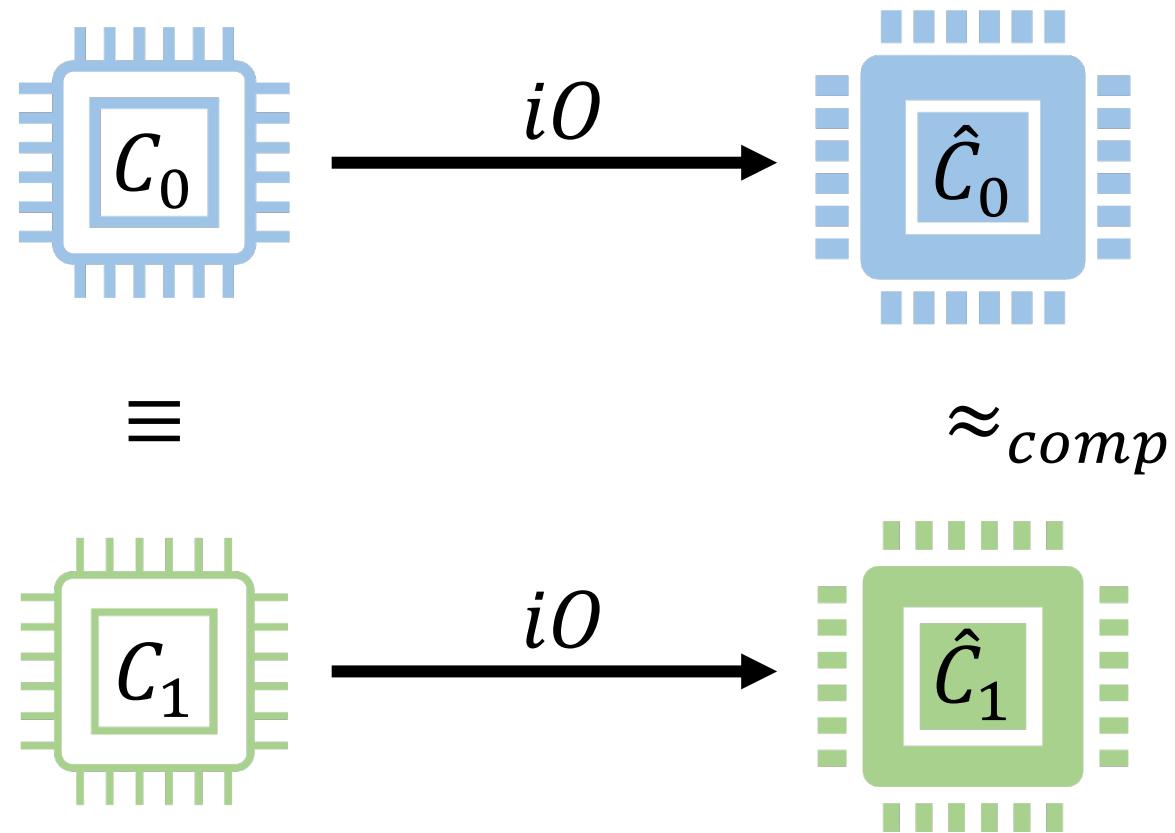

1. Using iO and injective PRGs, we construct a Hamming ball obfuscator.
  - Construction uses a new gadget: **PRG with Self-Correction**.
  - Using this, we build computational wiretap coding schemes for binary asymmetric channels (BAC) and binary asymmetric erasure channels (BAEC).
2. We introduce a polytope characterization of degradation.
  - Using this polytope characterization, we reduce the problem of constructing a computational wiretap coding scheme for any non-degraded binary-input channel pair to constructing one for (BAC, BAEC).

Focus of this talk:  
A computational wiretap coding  
scheme from  $iO$  for  
 $(ChB = BSC_{0.1}, ChE = BEC_{0.3})$

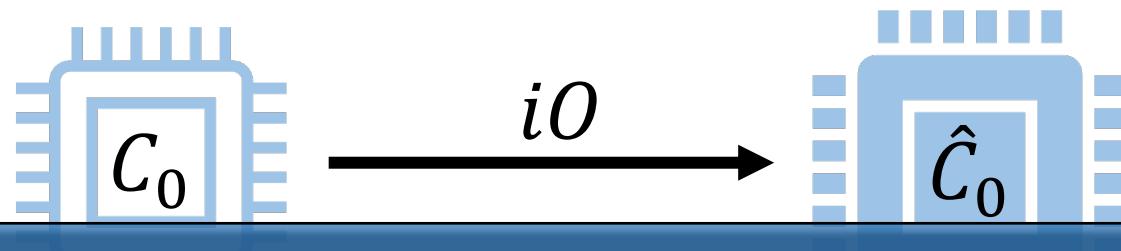

\*Construction idea easily extends to the non-degraded (BAC, BAEC) setting.

\*\*See paper or slide appendix for extension to all non-degraded binary-input.

# Indistinguishability Obfuscation ( $iO$ ) [BGIRSVY01]

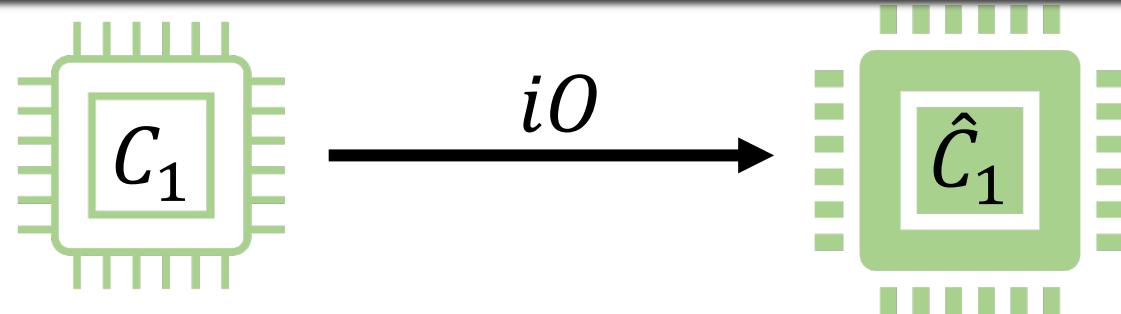

# Indistinguishability Obfuscation ( $iO$ ) [BGIRSVY01]

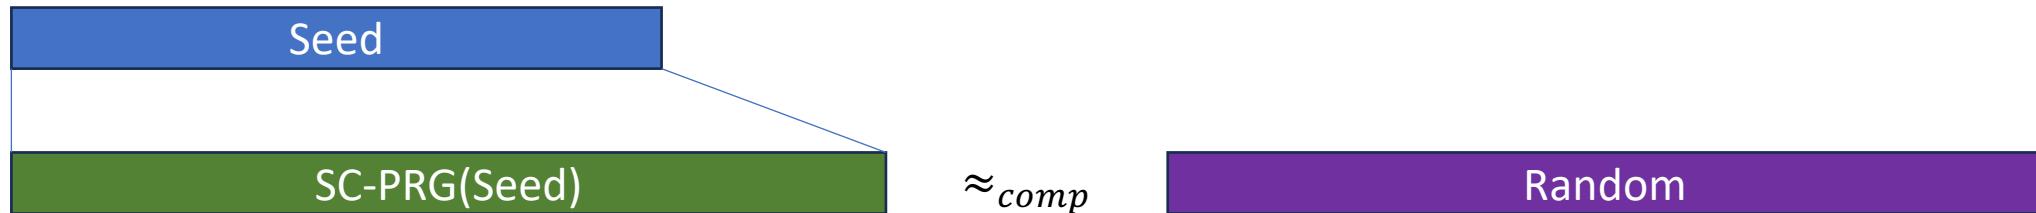

Now known from standard hardness assumptions !! [JLS21]

$\approx_{comp}$

# New Gadget: PRG with Self-Correction (SCPRG)

## 1. Polynomial Stretch & Pseudorandomness

## 2. $\varepsilon$ -Self-Correction

where Seed' agrees with Seed  
on at least  $\frac{1}{2} + \varepsilon$  fraction of bits,

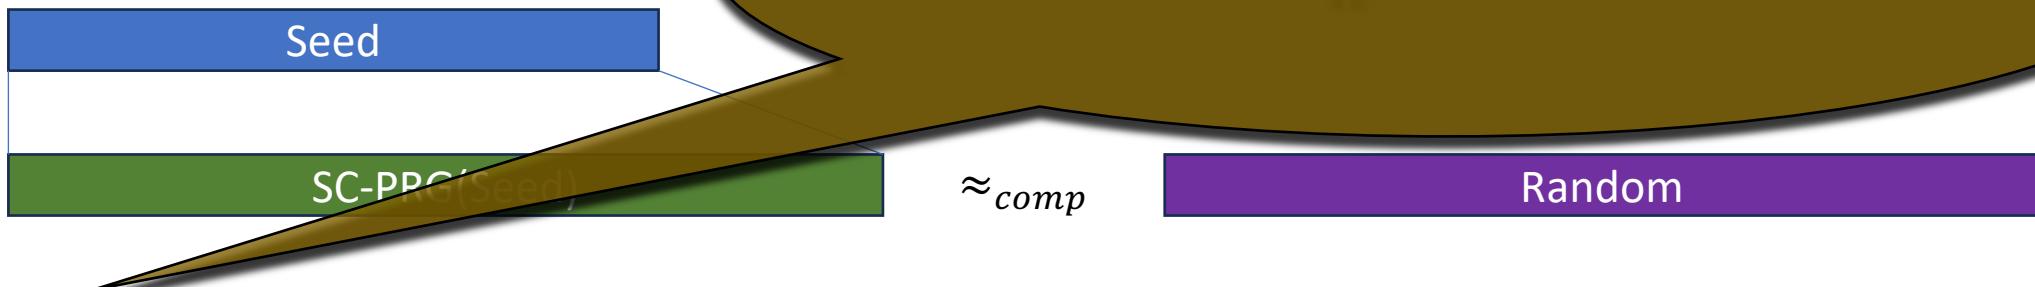

Can efficiently recover

# New Gadget: PRG with Self-Correction (SCPRG)

## 1. Polynomial Stretch & Pseudorandomness

For this talk,  $\varepsilon = \frac{1}{12}$ . In general, some constant.

## 2. $\varepsilon$ -Self-Correction (recovery works w.h.p. over choices of seeds)

where Seed' agrees with Seed  
on at least  $\frac{1}{2} + \varepsilon$  fraction of bits,

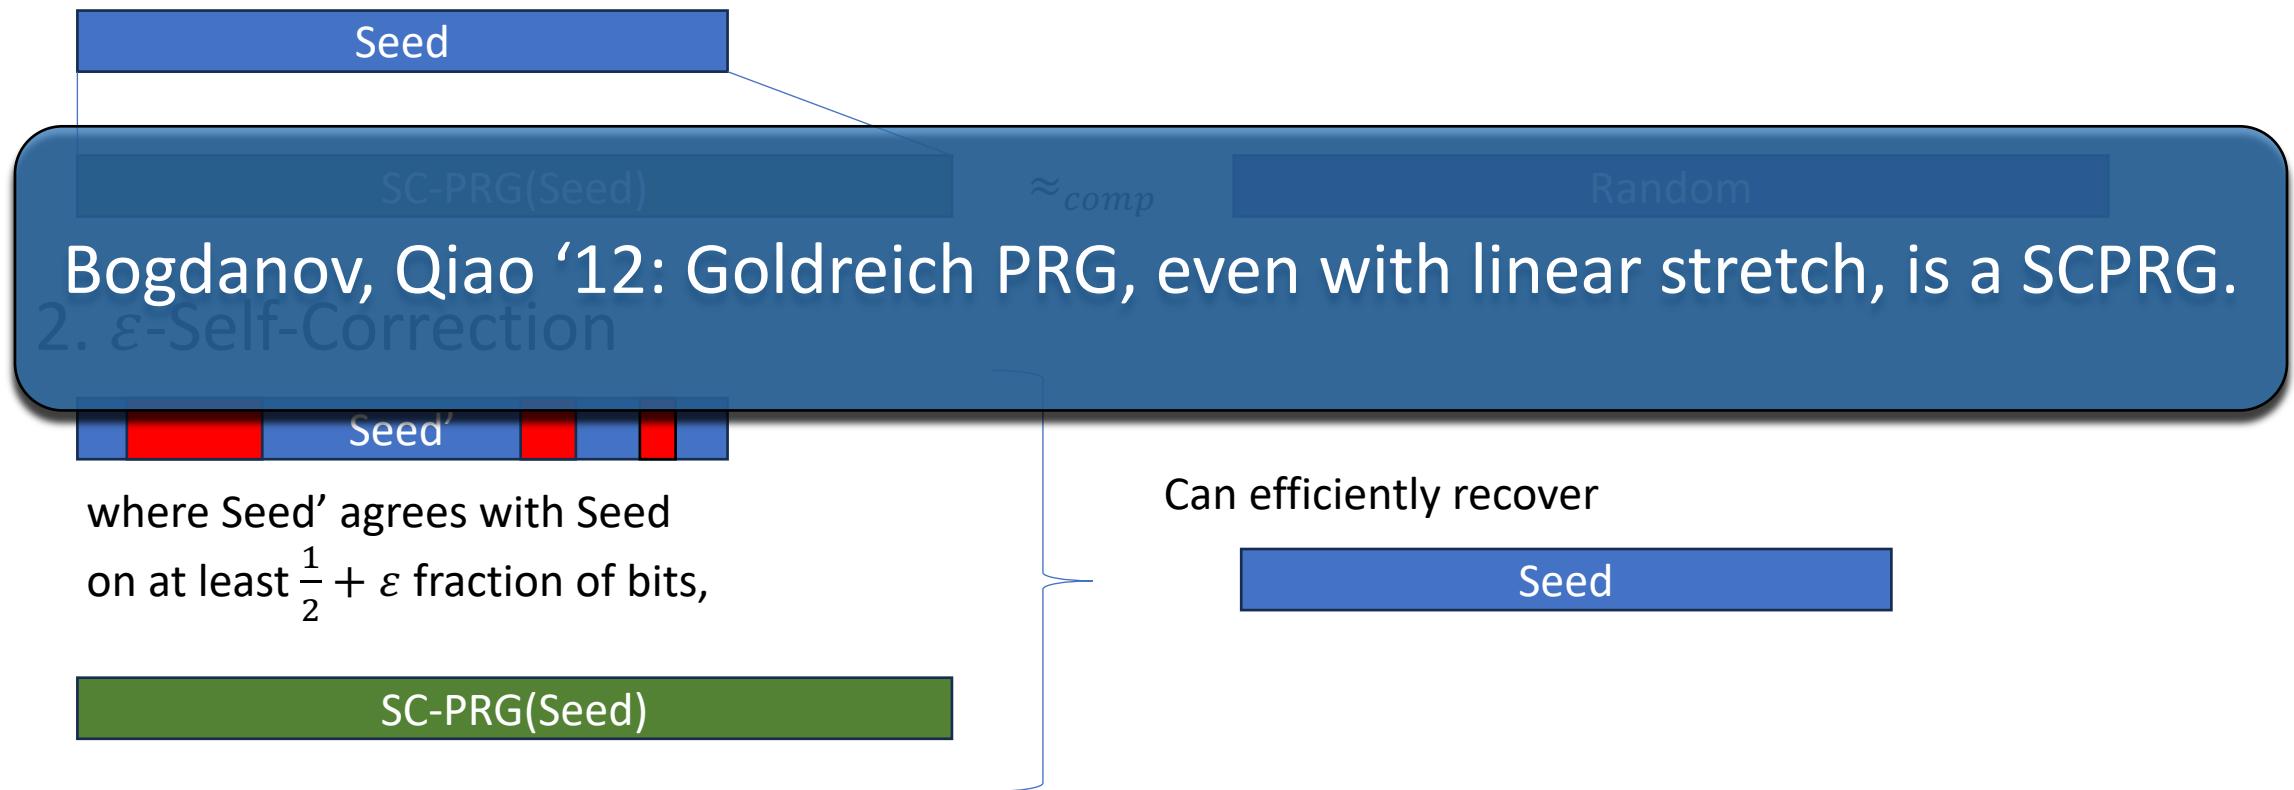

Can efficiently recover

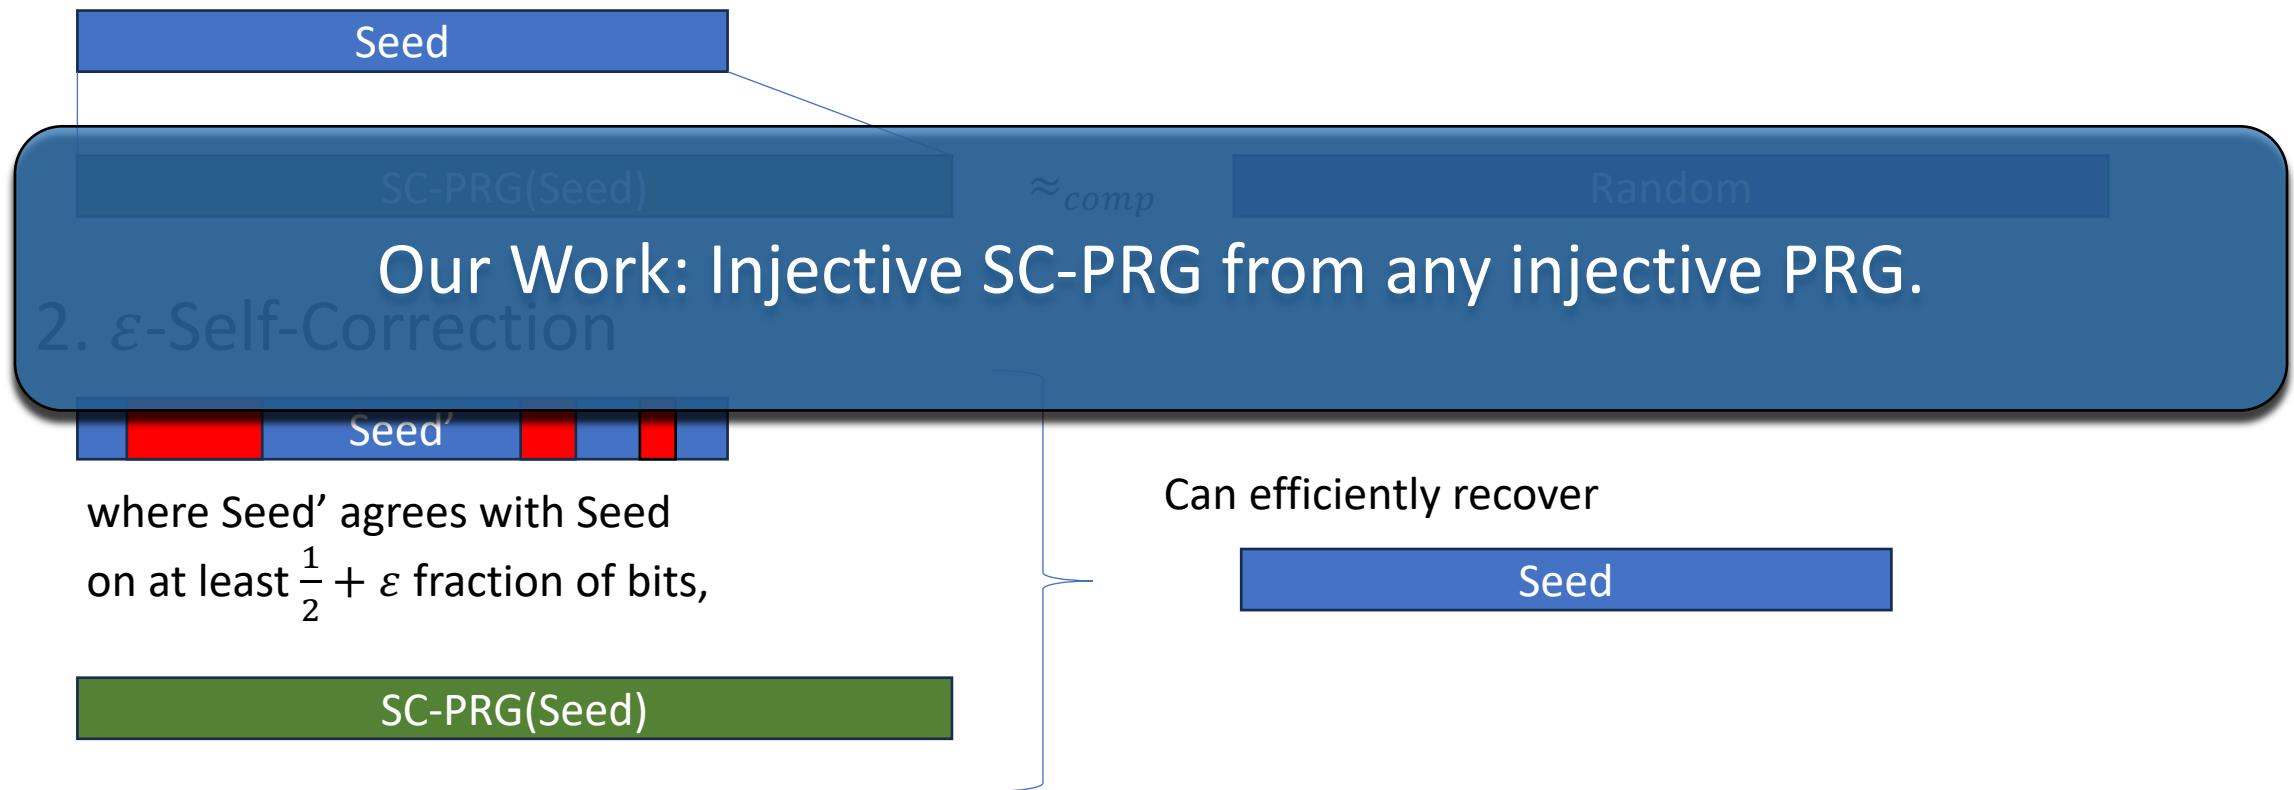

# New Gadget: PRG with Self-Correction (SCPRG)

## 1. Polynomial Stretch & Pseudorandomness

## 1. Polynomial Stretch & Pseudorandomness

$$ChB = BSC_{0.1}, ChE = BEC_{0.3}$$

**Using ideal obfuscation [IKLS22]:** Send a uniform random  $r \in \{0,1\}^n$  across the wiretap channel. Then, send an obfuscation of  $f_r$ , encoded to Bob's channel.

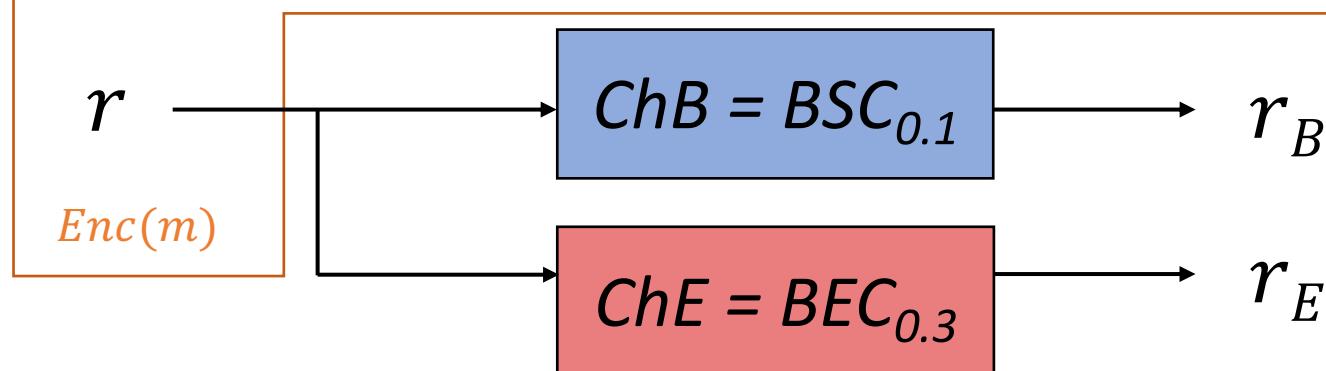

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

**Correctness:**

$f_r(r_B) = m$  with high probability

$$ChB = BSC_{0.1}, ChE = BEC_{0.3}$$

**Using ideal obfuscation [IKLS22]:** Send a uniform random  $r \in \{0,1\}^n$  across the wiretap channel. Then, send an obfuscation of  $f_r$ , encoded to Bob's channel.

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

**Correctness:**

$f_r(r_B) = m$  with high probability

$r$

$Enc(m)$

Eve's best guess for  $r'$  has  $\approx 0.15$  error rate.

If we were using an ideal obfuscation, then  $r$  and  $m$  are hidden.

$$ChB = BSC_{0.1}, ChE = BEC_{0.3}$$

**Construction:** Send a uniform random  $r \in \{0,1\}^n$  across the wiretap channel. Then, send an  $iO$  of  $f_r$ , encoded to Bob's channel.

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

**Correctness:**

$f_r(r_B) = m$  with high probability

$r$

$Enc(m)$

Security: Why does  $iO(f_r)$  hide  $m$  or  $r$ ?

# Security: What Does Eve See?

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

Eve does not know:

$$r = 1010010110$$

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Security: What Does Eve See?

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

Eve does not know:

Goal: Use a hybrid argument to show that this circuit is indistinguishable from the null circuit.

$$r = 1010010110$$

Problem: There are **exponentially** many points in the Hamming ball!

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Security: What Does Eve See?

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

Eve does not know:

$$r = 1010010110$$

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Critical observation: In intermediate hybrids, this circuit can depend on the actual received string  $r_E$ .

# Security: What Does Eve See?

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

$$S_\perp = \{1, 5, 10\}$$

$$S_{0,1} = [10] \setminus S_\perp$$

Eve does not know:

$$r = 1010010110$$

$f_r(r')$ :

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Critical observation: In intermediate hybrids, this circuit can depend on the actual received string  $r_E$ .

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \textcolor{red}{\perp} 010 \textcolor{red}{\perp} 1011 \textcolor{red}{\perp}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = \textcolor{red}{1} 010 \textcolor{red}{0} 1011 \textcolor{red}{0}$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Split the hardcoded  $r$  into  
two substrings depending  
on  $S_{\perp}$

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

- If  $\Delta(r', r) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

$r'$  is Eve's guess.

Eve does not know:

$$r = 1010010110$$

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = \underline{1}010\underline{0}1011\underline{0}$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Rewrite the Hamming  
distance condition

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = 1010010110$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, s_{\perp}$

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

$r'_{S_{\perp}}, r'_{S_{0,1}}$  are substrings  
of Eve's guess.

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Eve does not know:

$$r = \underline{1}010\underline{0}1011\underline{0}$$

$r_{S_{\perp}}, r_{S_{0,1}}$  are substrings of  
the sent random string.

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Functionally  
Equivalent to  $f_r(\cdot)!!$

$$f^{(1)}(r'):$$

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Eve does not know:

$$r = \underline{1}010\underline{0}1011\underline{0}$$

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = 1010010110$$

Eve knows the non-erased coordinates.

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Security: An Indistinguishable Viewpoint

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\}$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_1, S_{\perp}}$

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Eve does not know:

$$r = \underline{1}010010110$$

Eve's best strategy is to uniformly guess for  $r'_{S_{\perp}}$ .  
There are exponentially many guesses that cause the function to  
output  $m$ .

We will compress them into a single branch that can be removed  
by a hybrid argument.

# Using injective length-tripling SCPRGs

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = 1010010110$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}$ ,  $r_{S_{\perp}}$ ,  $S_{\perp}$ .

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Using injective length-tripling SCPRGs

Eve sees:

$$r_E = \underline{1}010\underline{1}1011\underline{1}$$

$$S_{\perp} = \{1, 5, 10\}$$

$f^{(1)}(r')$ :

Constants:  $r_{S_{0,1}}, r_{S_{\perp}}, S_{\perp}$ .

Eve does not know:

$$r = 1010010110$$

Replace with  $SCPRG_{\varepsilon}(r_{S_{\perp}})$  for some choice of  $\varepsilon$  dependent on degradation condition. Here,  $\varepsilon = \frac{1}{12}$ .

- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Using injective length-tripling SCPRGs

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

$$S_{\perp} = \{1, 5, 10\}$$

$f^{(2)}(r')$ :

Constants:  $r_{S_{0,1}}$ ,  $SCPRG_{\varepsilon}(r_{S_{\perp}})$ ,  $S_{\perp}$ .

- Let  $\alpha := SCPRG_{\varepsilon}.Recover(SCPRG_{\varepsilon}(r_{S_{\perp}}), r'_{S_{\perp}})$ .
- If  $SCPRG_{\varepsilon}(\alpha) \neq SCPRG_{\varepsilon}(r_{S_{\perp}})$ , then output  $\perp$ .
- Otherwise, set  $r_{S_{\perp}} \leftarrow \alpha$ .
- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

Eve does not know:

$$r = 1010010110$$

Parameter  $\varepsilon$ , dependent on degradation condition, is set so that Eve is unable to recover.

Here,  $\varepsilon = \frac{1}{12}$ .

# Using injective length-tripling SCPRGs

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = 1010010110$$

$f^{(2)}(r')$ :

From Eve's point of view,  $r_{S_{\perp}}$  is an unknown uniform random string.

Constants:  $r_{S_{0,1}}, SC - PRG_{\varepsilon}(r_{S_{\perp}}), S_{\perp}$ .

- Let  $\alpha := SCPRG_{\varepsilon}.Recover(SCPRG_{\varepsilon}(r_{S_{\perp}}), r'_{S_{\perp}})$ .
- If  $SCPRG_{\varepsilon}(\alpha) \neq SCPRG_{\varepsilon}(r_{S_{\perp}})$ , then output  $\perp$ .
- Otherwise, set  $r_{S_{\perp}} \leftarrow \alpha$ .
- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Using injective length-tripling SCPRGs

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

$$S_{\perp} = \{1, 5, 10\} \quad S_{0,1} = [10] \setminus S_{\perp}$$

Eve does not know:

$$r = 1010010110$$

$f^{(3)}(r')$ :

Can therefore apply pseudorandomness property.

Constants:  $r_{S_{0,1}}, R, S_{\perp}$ .

- Let  $\alpha := \text{SCPRG}_{\varepsilon}.\text{Recover}(R, r'_{S_{\perp}})$ .
- If  $\text{SCPRG}_{\varepsilon}(\alpha) \neq R$ , then output  $\perp$ .
- Otherwise, set  $r_{S_{\perp}} \leftarrow \alpha$ .
- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

# Using injective length-tripling SCPRGs

Eve sees:

$$r_E = \perp 010 \perp 1011 \perp$$

$$S_{\perp} = \{1, 5, 10\}$$

$f^{(3)}(r')$ :

Constants:  $r_{S_{0,1}}, R, S_{\perp}$ .

- Let  $\alpha := \text{SCPRG}_{\varepsilon}.\text{Recover}(R, r'_{S_{\perp}})$ .
- If  $\text{SCPRG}_{\varepsilon}(\alpha) \neq R$ , then output  $\perp$ .
- Otherwise, set  $r_{S_{\perp}} \leftarrow \alpha$ .
- If  $\Delta(r'_{S_{\perp}}, r_{S_{\perp}}) + \Delta(r'_{S_{0,1}}, r_{S_{0,1}}) < 0.1n + n^{0.9}$  output  $m$
- Output  $\perp$  otherwise.

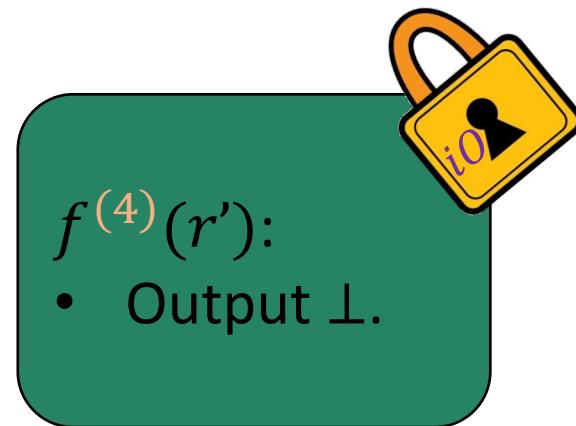

Eve does not know:

$$r = 1010010110$$

With overwhelming probability  $R$  is not in the range of the *SCPRG*, so will be functionally equivalent to null circuit.

# End of the Security Proof: Null Circuit

# “Code Offset” construction of SCPRG

Injective PRG  $G$ .

List-decodable error correcting code  $\mathcal{C}$   
for up to  $\frac{1}{2} - \varepsilon$  error rate for any  
constant  $\varepsilon > 0$ .

Concatenated code of binary Reed-Solomon codes with  
Hadamard code [Sudan, Trevisan, Vadhan '99, Sudan '00]

$SCPRG_\varepsilon(s_1, s_2) :$   
• Output  $(s_1 + \mathcal{C}(s_2), G(s_2))$ .

# “Code Offset” construction of SCPRG

Injective PRG  $G$ .

List-decodable error correcting code  $\mathcal{C}$   
for up to  $\frac{1}{2} - \varepsilon$  error rate for any  
constant  $\varepsilon > 0$ .

e.g. concatenated code of binary Reed-Solomon codes  
with Hadamard code  
[Sudan, Trevisan, Vadhan '99, Sudan '00]

$SCPRG_\varepsilon(s_1, s_2) :$

- Output  $(s_1 + \mathcal{C}(s_2), G(s_2))$ .

Pseudorandomness:  $s_1$  is uniform random, so  $s_1 + \mathcal{C}(s_2)$  is uniform random. Then, apply pseudorandomness of  $G(s_2)$ .

# “Code Offset” construction of SCPRG

Injective PRG  $G$ .

List-decodable error correcting code  $\mathcal{C}$   
for up to  $\frac{1}{2} - \varepsilon$  error rate for any  
constant  $\varepsilon > 0$ .

e.g. concatenated code of binary Reed-Solomon codes  
with Hadamard code  
[Sudan, Trevisan, Vadhan '99, Sudan '00]

$SCPRG_\varepsilon(s_1, s_2) :$

- Output  $(s_1 + \mathcal{C}(s_2), G(s_2))$ .

**Self-correction:** Can show, if  $s'_1, s'_2 \approx s_1, s_2$  and for appropriate lengths of  $s_1$  and  $s_2$ , then  $s'_1 \approx s_1$ .

Therefore, if  $s'_1, s'_2 \approx s_1, s_2$  then can recover a polynomial size list containing  $s_2$  from  $s_1 + \mathcal{C}(s_2)$ .

Use  $G(s_2)$  iterate over list to find  $s_2$ , then recover  $s_1$ .

# Recap

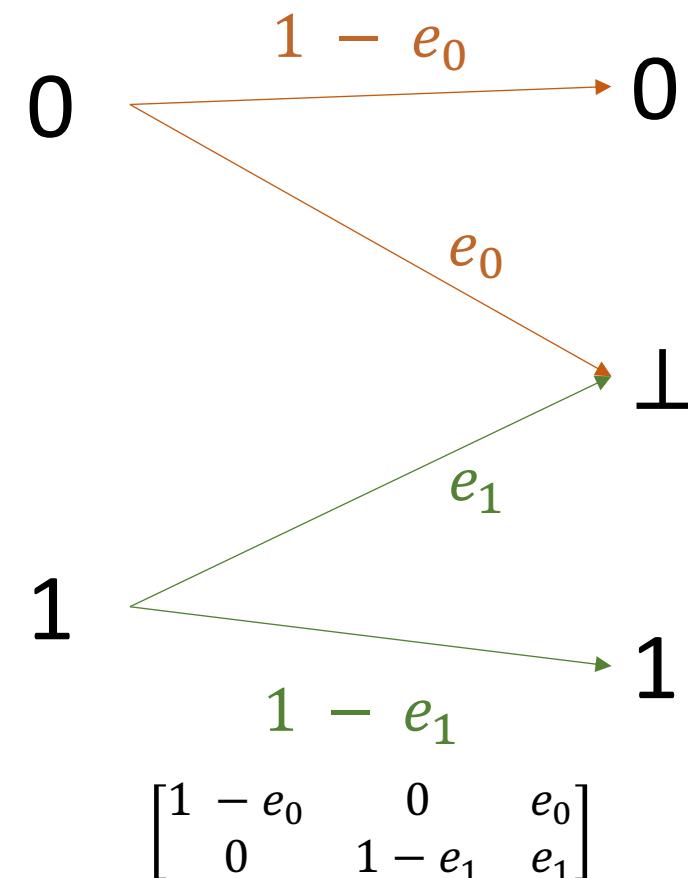

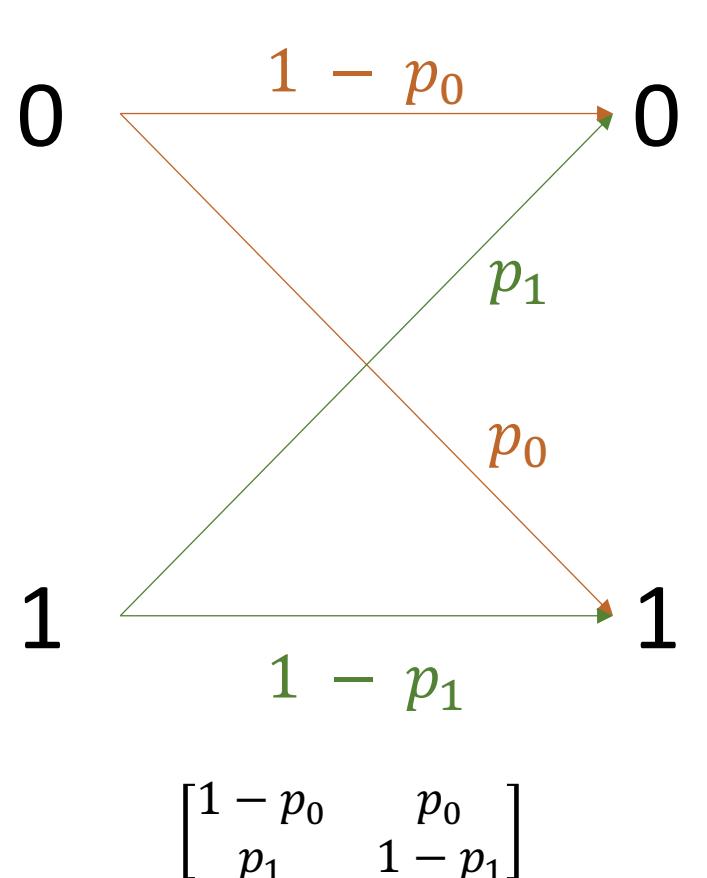

We sketched the construction and security proof for a computational wiretap coding scheme for the non-degraded ( $BSC, BEC$ ) case via  $iO$  & injective PRG.

**Theorem:** Assuming the existence of indistinguishability obfuscation (*iO*) and injective PRGs, there exists a computational wiretap coding scheme for any pair of non-degraded **binary-input** channels ( $ChB, ChE$ ).

1. The given construction idea easily extends to the non-degraded ( $BAC, BAEC$ ) setting.

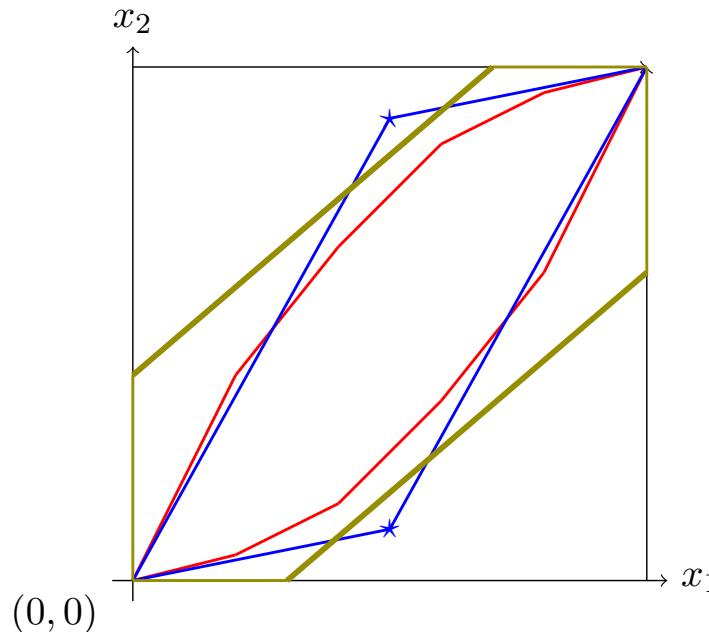

**Theorem:** Assuming the existence of indistinguishability obfuscation (*iO*) and injective PRGs, there exists a computational wiretap coding scheme for any pair of non-degraded **binary-input** channels ( $ChB, ChE$ ).

1. The given construction idea easily extends to the non-degraded ( $BAC, BAEC$ ) setting.

**Theorem:** Assuming the existence of indistinguishability obfuscation (*iO*) and injective PRGs, there exists a computational wiretap coding scheme for any pair of non-degraded **binary-input** channels ( $ChB, ChE$ ).

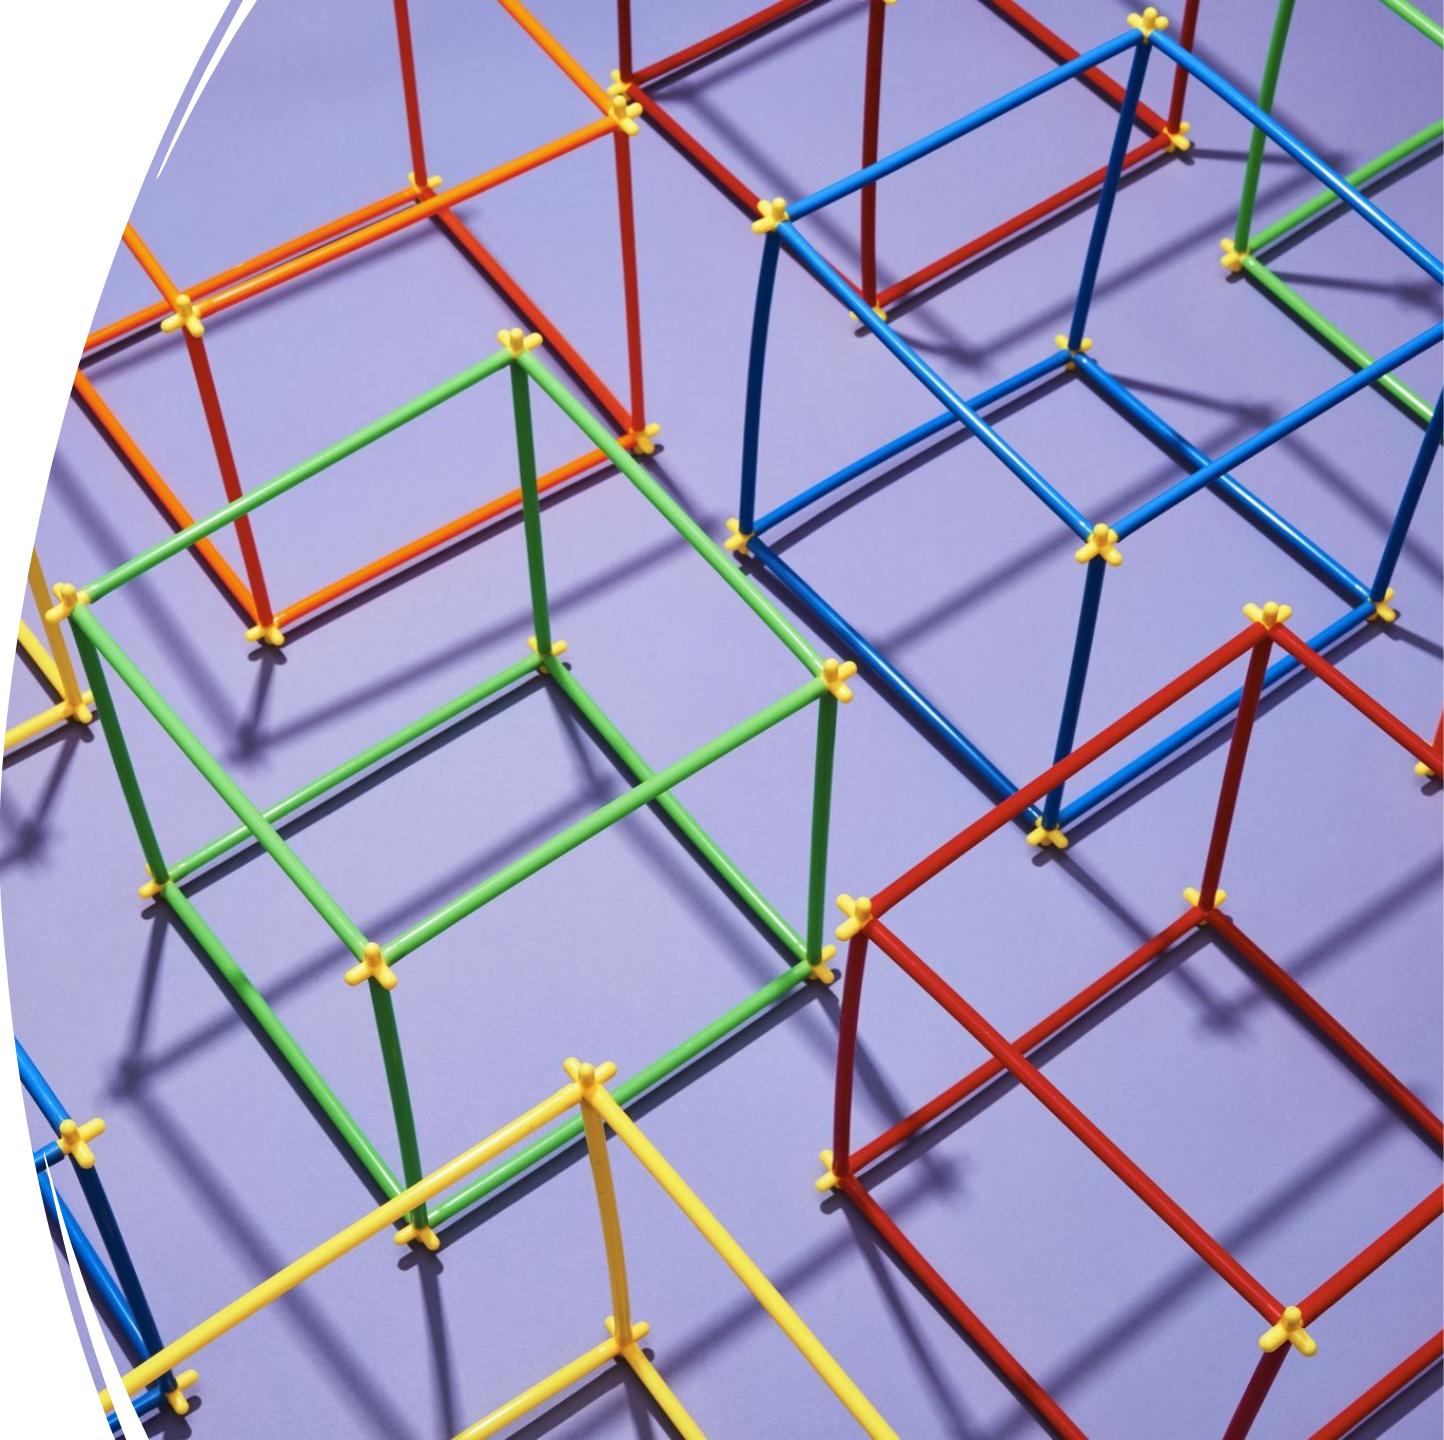

1. The given construction idea easily extends to the non-degraded ( $BAC, BAEC$ ) setting.
2. The case of every non-degraded binary-input channel pair ( $ChB, ChE$ ) reduces to (1).

# Some Open Directions

---

- Expanding construction beyond binary-input channels.
  - Characterize degradation for dimension three and beyond.
- Realizing computational wiretap coding from simpler cryptographic primitives or directly from hardness assumptions like LWE.
- Addressing the asterisk\* in the initial riddle: Can we derandomize the encoding?

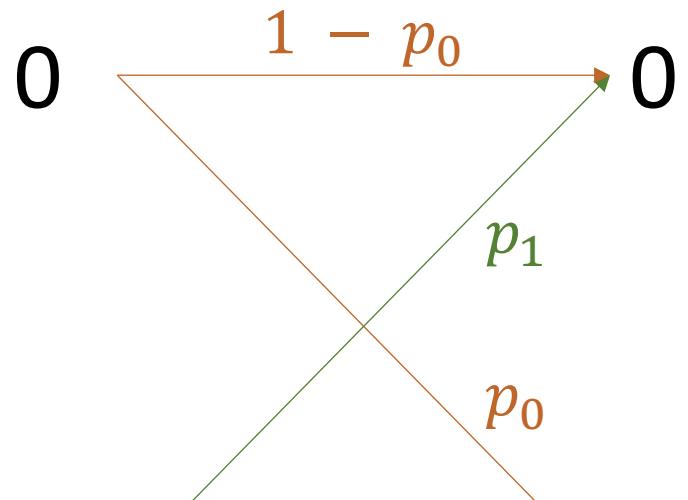

Thank you !

# Appendix: The BAC/BAEC Case and General Binary-Input Case

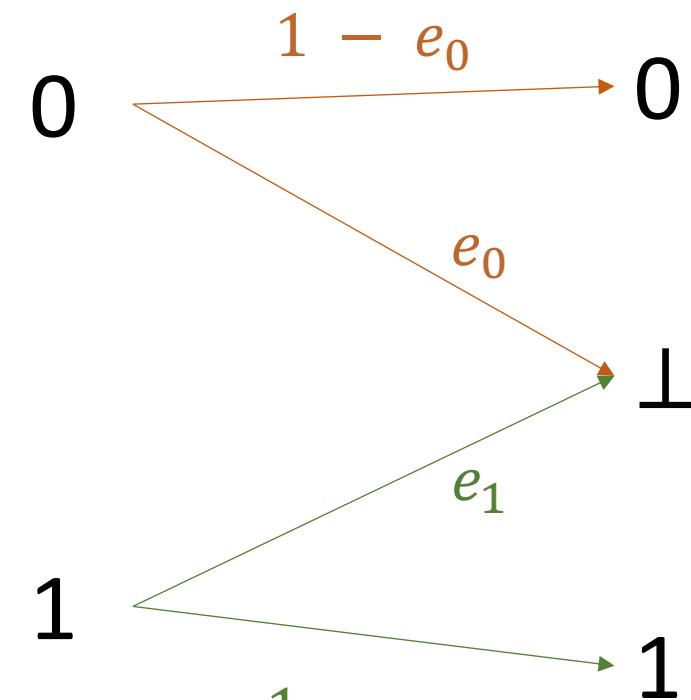

# Asymmetric Binary Channels

Binary Asymmetric Channel (BAC)

$$\begin{bmatrix} 1 - p_0 & p_0 \\ p_1 & 1 - p_1 \end{bmatrix}$$

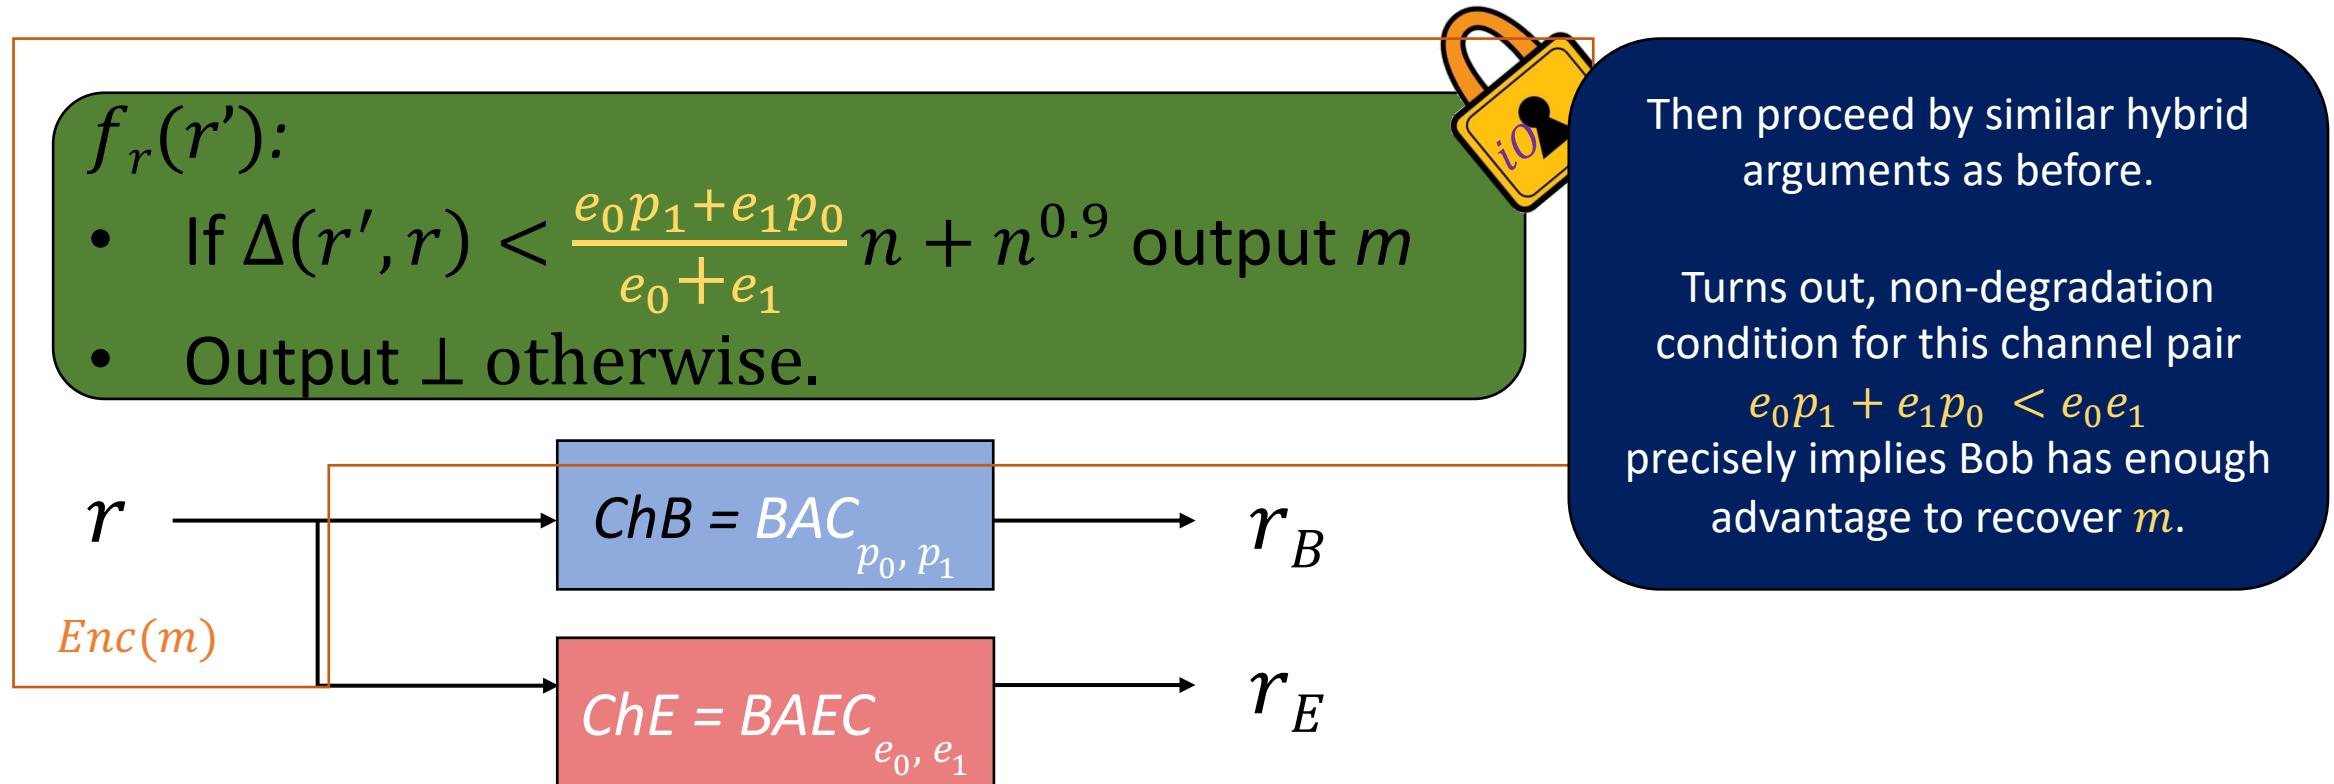

Binary Asymmetric Erasure Channel (BAEC)

$$\begin{bmatrix} 1 - e_0 & 0 & e_0 \\ 0 & 1 - e_1 & e_1 \end{bmatrix}$$

$$ChB = BAC_{p_0, p_1}, \quad ChE = BAEC_{e_0, e_1}$$

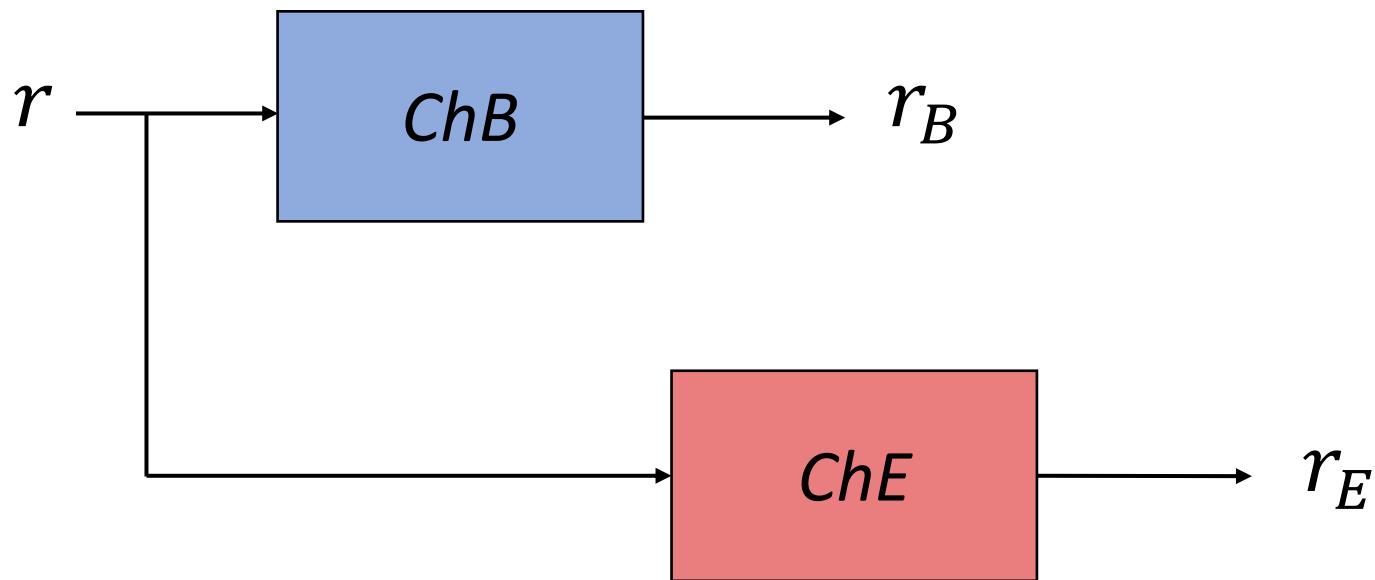

**Construction:** Same as before, except initial distribution is such that from Eve's view, each erasure equally likely to have been 0 or 1.

Pairs of Binary-input Channels  
Reduce to the BAC/BAEC Case

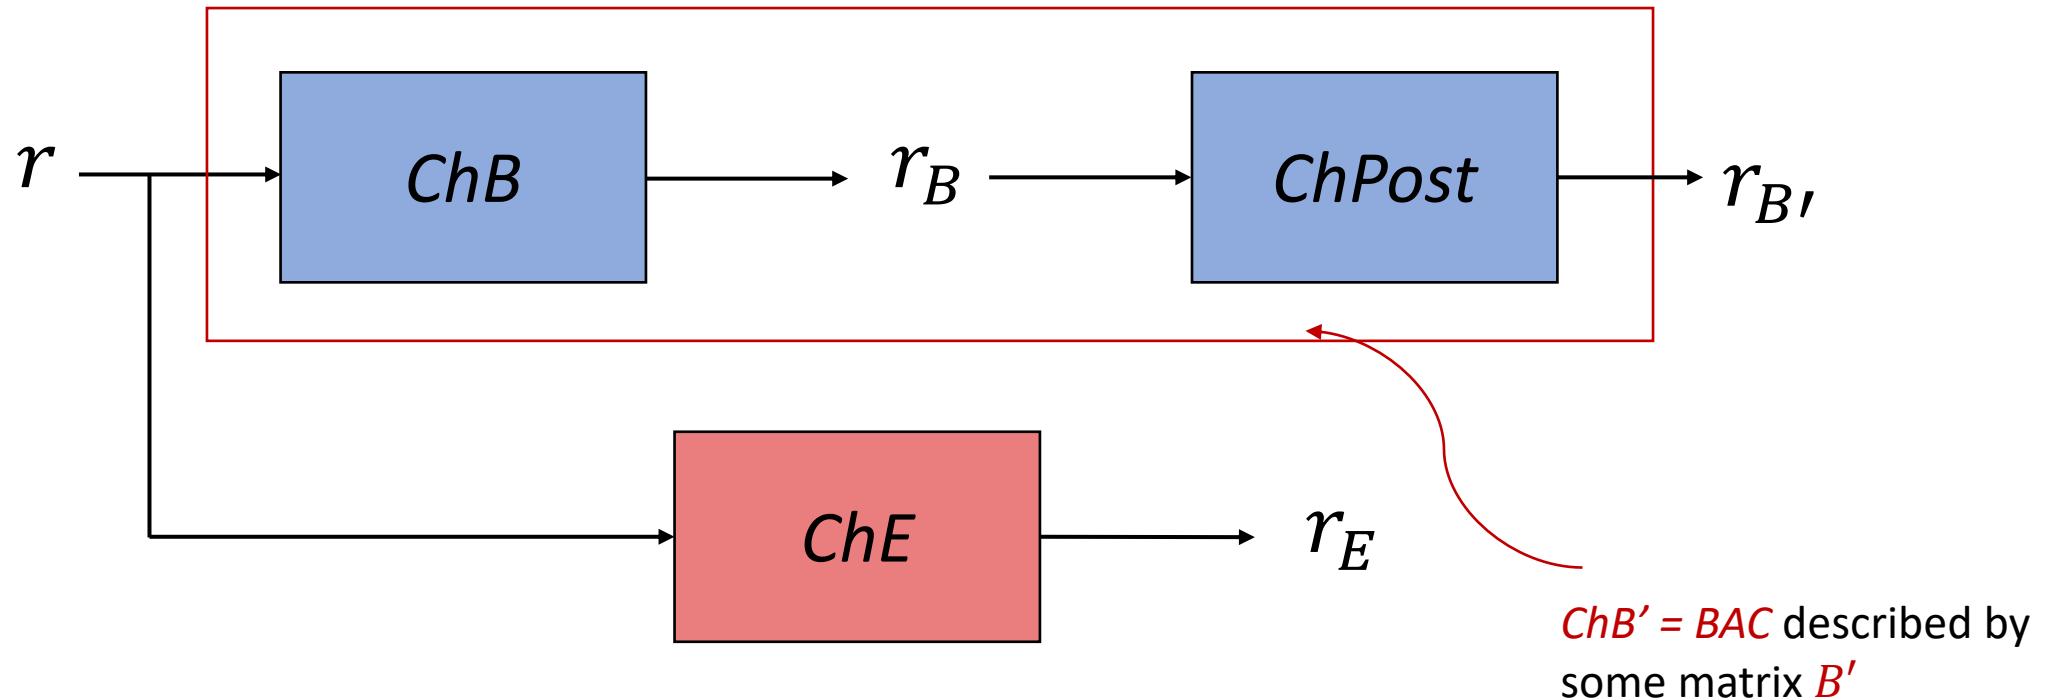

# Pair of Arbitrary Binary Input Channels

Consider  $(B = \begin{bmatrix} u_{11} & \cdots & u_{1n_B} \\ u_{21} & \cdots & u_{2n_B} \end{bmatrix}, E = \begin{bmatrix} u_{11} & \cdots & u_{1n_E} \\ u_{21} & \cdots & u_{2n_E} \end{bmatrix})$  s.t.  $B$  not a degradation of  $E$ .

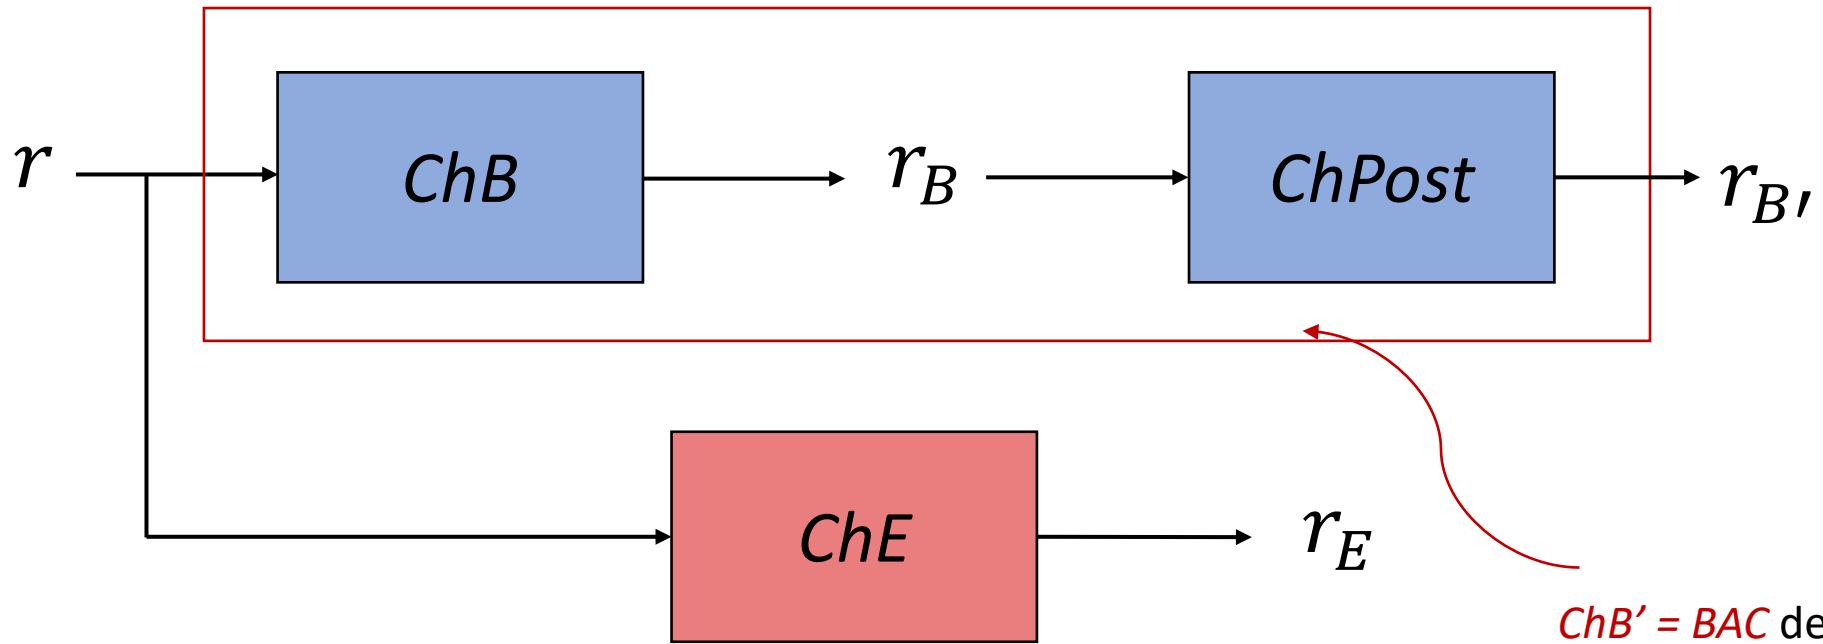

# Reducing Pair of Arbitrary Binary Input Channels to BAC/BAEC Case: Bob's Output Alphabet

Consider  $(B = \begin{bmatrix} u_{11} & \cdots & u_{1n_B} \\ u_{21} & \cdots & u_{2n_B} \end{bmatrix}, E = \begin{bmatrix} u_{11} & \cdots & u_{1n_E} \\ u_{21} & \cdots & u_{2n_E} \end{bmatrix})$  s.t.  $B$  not a degradation of  $E$ .

# Reducing Pair of Arbitrary Binary Input Channels to BAC/BAEC Case: Bob's Output Alphabet

Consider ( $B' = \begin{bmatrix} u'_{11} & u'_{12} \\ u'_{21} & u'_{22} \end{bmatrix}$ ,  $E = \begin{bmatrix} v_{11} & \cdots & v_{1n_E} \\ v_{21} & \cdots & v_{2n_E} \end{bmatrix}$ ) s.t.  $B'$  not a degradation of  $E$ .

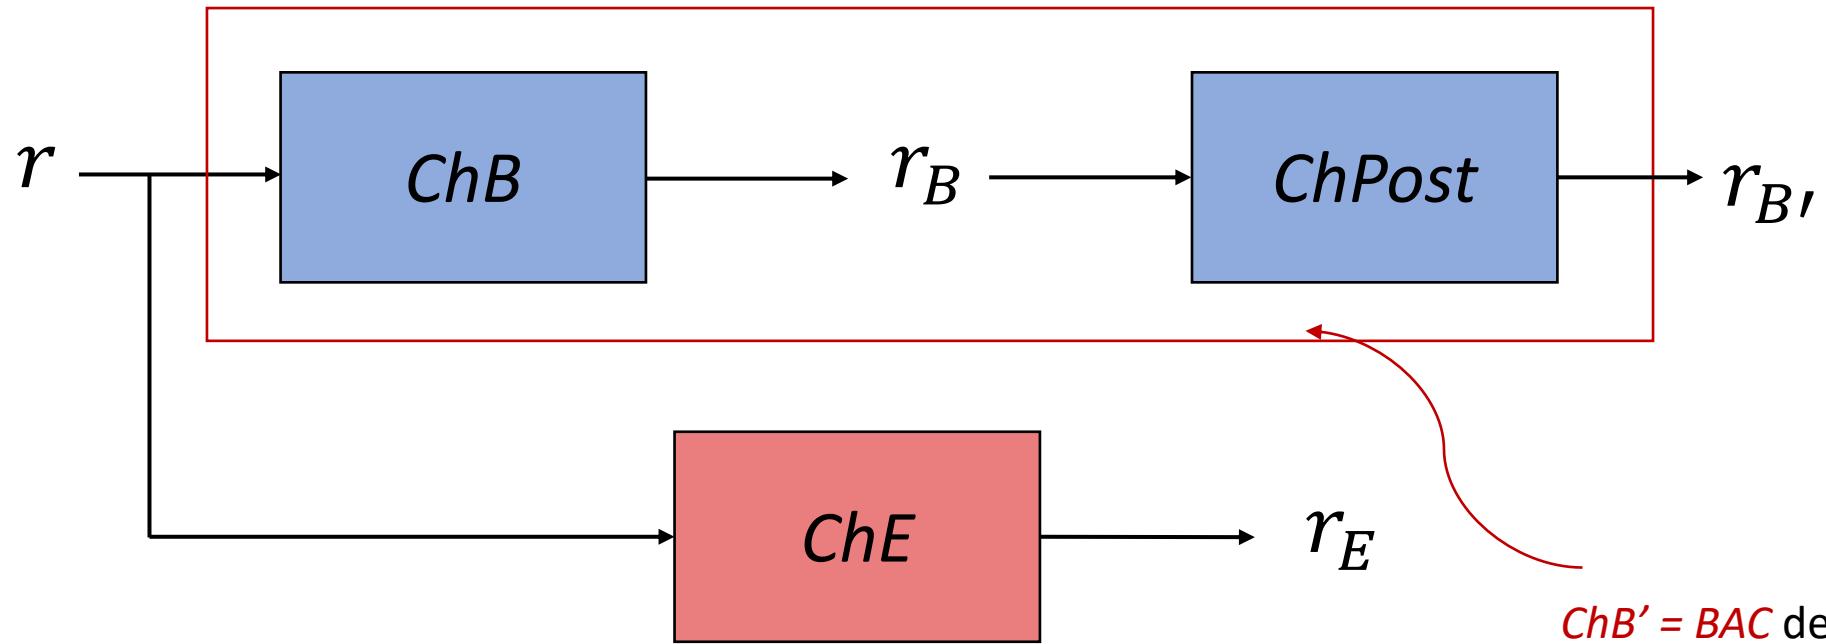

$ChB' = BAC$  described by some matrix  $B'$

Find  $B'$  s.t. (1)  $B'$  not a degradation of  $E$ .  
(2)  $B'$  degradation of  $B$ .

# Reducing Pair of Arbitrary Binary Input Channels to BAC/BAEC Case: Bob's Output Alphabet

Consider ( $B' = \begin{bmatrix} u'_{11} & u'_{12} \\ u'_{21} & u'_{22} \end{bmatrix}$ ,  $E = \begin{bmatrix} v_{11} & \cdots & v_{1n_E} \\ v_{21} & \cdots & v_{2n_E} \end{bmatrix}$ ) s.t.  $B'$  not a degradation of  $E$ .

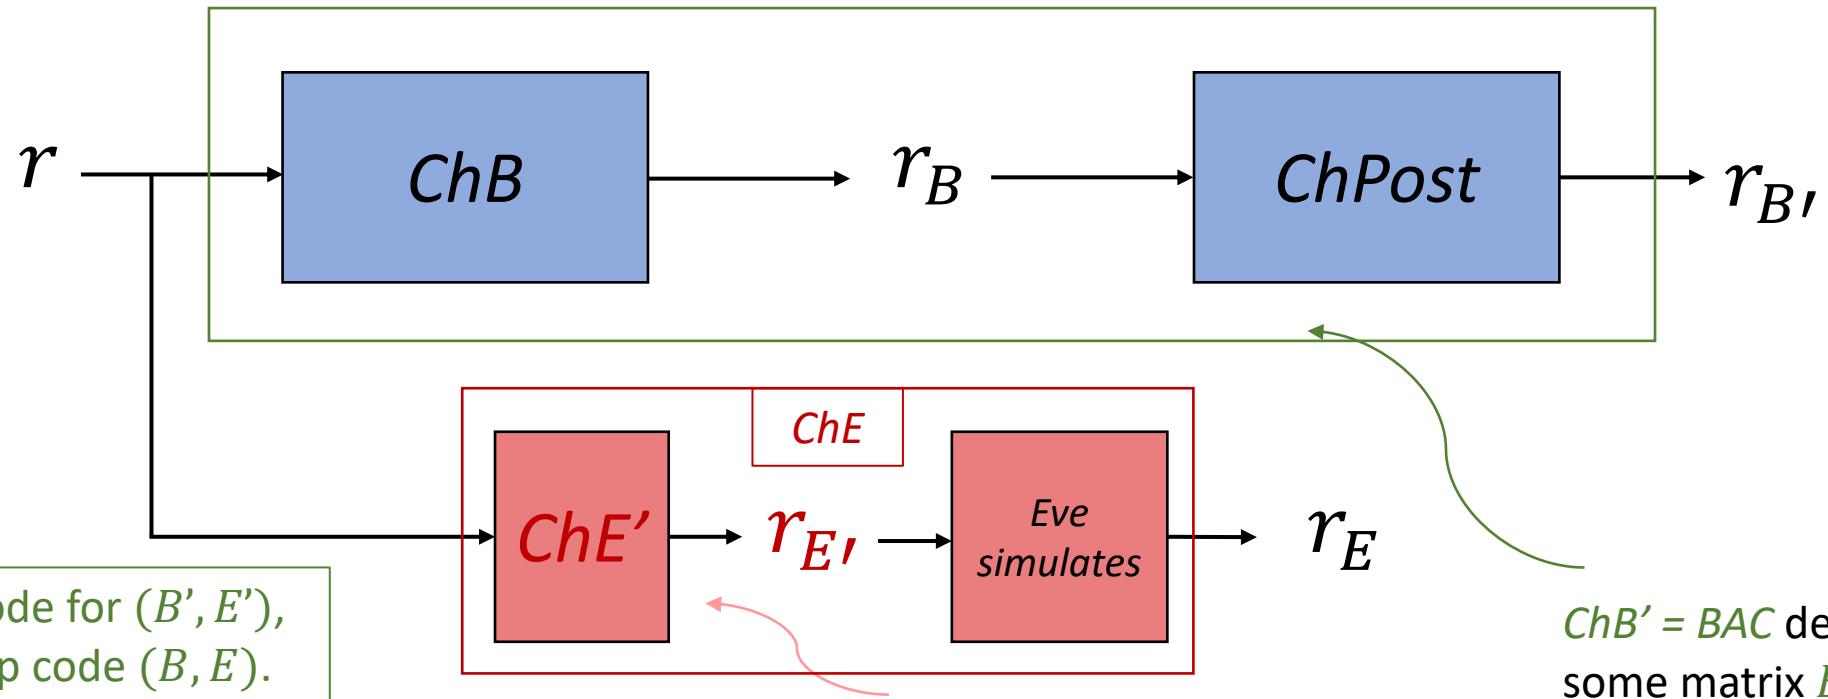

$ChB' = BAC$  described by some matrix  $B'$

Find  $B'$  s.t. (1)  $B'$  not a degradation of  $E$ .  
 (2)  $B'$  degradation of  $B$ .

Any wiretap code for  $(B', E)$ , gives a wiretap code  $(B, E)$ .

# Reducing Pair of Arbitrary Binary Input Channels to BAC/BAEC Case: Simulating ChE with a BAEC

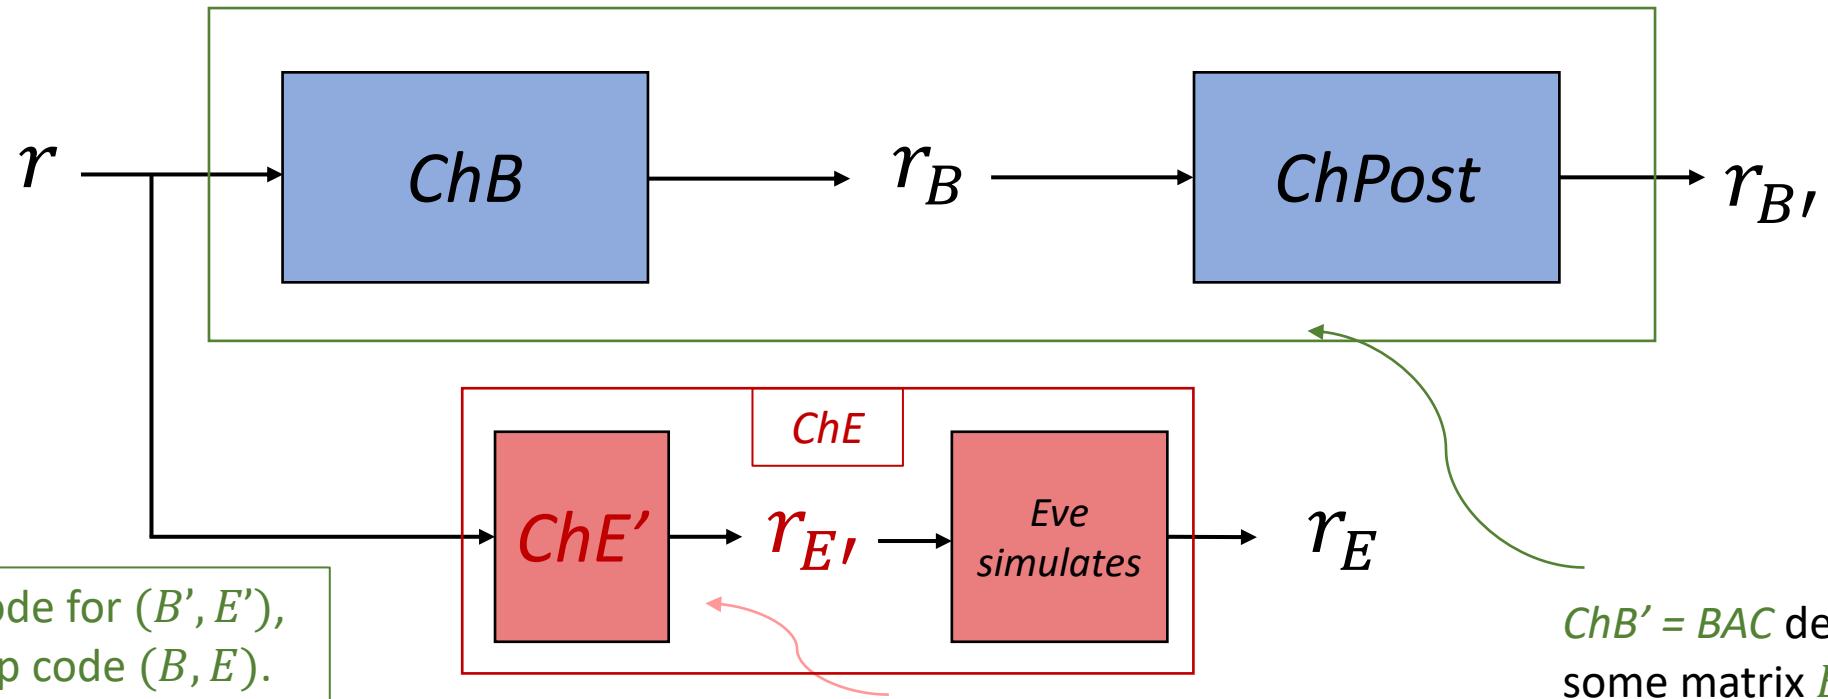

Consider  $(B' = \begin{bmatrix} u'_{11} & u'_{12} \\ u'_{21} & u'_{22} \end{bmatrix}, E = \begin{bmatrix} v_{11} & \cdots & v_{1n_E} \\ v_{21} & \cdots & v_{2n_E} \end{bmatrix})$  such that  $\mathcal{P}(B') \not\subseteq \mathcal{P}(E)$ ,  $\mathcal{P}(B') \subseteq \mathcal{P}(B)$ .

Imagine that Eve instead receives an output through  $ChE' = BAEC$  described by some matrix  $E'$ , effectively giving Eve even more information, but hopefully not enough to simulate  $B'$ !

# Reducing Pair of Arbitrary Binary Input Channels to BAC/BAEC Case: Simulating ChE with a BAEC

Consider  $(B' = \begin{bmatrix} u'_{11} & u'_{12} \\ u'_{21} & u'_{22} \end{bmatrix}, E = \begin{bmatrix} v_{11} & \cdots & v_{1n_E} \\ v_{21} & \cdots & v_{2n_E} \end{bmatrix})$  such that  $\mathcal{P}(B') \not\subseteq \mathcal{P}(E)$ ,  $\mathcal{P}(B') \subseteq \mathcal{P}(B)$ .

Any wiretap code for  $(B', E')$ ,  
gives a wiretap code  $(B, E)$ .

$ChB' = BAC$  described by  
some matrix  $B'$

Imagine that Eve instead receives an output through  $ChE' = BAEC$  described by some matrix  $E'$ , effectively giving Eve even more information, but hopefully not enough to simulate  $B'$ !

# Finding BAEC $E'$ via Polytope Formulation

# A New Polytope formulation

**Def:** [Channel Polytope] Let  $A$  be a matrix of non-negative entries. We associate to  $A$  the following polytope, denoted  $\mathcal{P}(A)$ , which can be defined in either of the following equivalent ways:

- $\mathcal{P}(A)$ , is the convex hull of all subset-sums of columns of  $A$ .
- $\mathcal{P}(A) = \{Av : 0 \leq v \leq 1\}$ .

# A New Polytope formulation

**Def:** [Channel Polytope] Let  $A$  be a matrix of non-negative entries. We associate to  $A$  the following polytope, denoted  $\mathcal{P}(A)$ , which can be defined in either of the following equivalent ways:

- $\mathcal{P}(A)$ , is the convex hull of all subset-sums of columns of  $A$ .
- $\mathcal{P}(A) = \{Av : 0 \leq v \leq 1\}$ .

**Theorem:** Let  $B \in \mathbb{R}^{2 \times n_B}$  and  $E \in \mathbb{R}^{2 \times n_E}$  be arbitrary row-stochastic matrices. Then,  $B \neq E \cdot S$  for every row stochastic matrix  $S$  if and only if  $\mathcal{P}(B) \not\subseteq \mathcal{P}(E)$ .

# A New Polytope formulation

**Def:** [Channel Polytope] Let  $A$  be a matrix of non-negative entries. We associate to  $A$  the following polytope, denoted  $\mathcal{P}(A)$ , which can be defined in either of the following equivalent ways:

- $\mathcal{P}(A)$ , is the convex hull of all subset-sums of columns of  $A$ .
- $\mathcal{P}(A) = \{Av : 0 \leq v \leq 1\}$ .

**Theorem:** Let  $B \in \mathbb{R}^{2 \times n_B}$  and  $E \in \mathbb{R}^{2 \times n_E}$  be arbitrary row-stochastic matrices. Then,  $\text{Ch}B$  is not a degradation of  $\text{Ch}E$  if and only if  $\mathcal{P}(B) \not\subseteq \mathcal{P}(E)$ .

# A New Polytope formulation

**Def:** [Channel Polytope] Let  $A$  be a matrix of non-negative entries. We associate to  $A$  the following polytope, denoted  $\mathcal{P}(A)$ , which can be defined in either of the following equivalent ways:

- $\mathcal{P}(A)$ , is the convex hull of all subset-sums of columns of  $A$ .
- $\mathcal{P}(A) = \{x \in \mathbb{R}^n : x \geq 0, Ax \leq 1\}$

In the interest of time, we will not sketch the proof.

If row count > 2, then this is false.  
Explicit counterexample for case of 3.

**Theorem:** Let  $B \in \mathbb{R}^{2 \times n_B}$  and  $E \in \mathbb{R}^{2 \times n_E}$  be arbitrary row-stochastic matrices. Then,  $\text{Ch}B$  is not a degradation of  $\text{Ch}E$  if and only if  $\mathcal{P}(B) \not\subseteq \mathcal{P}(E)$ .

# Polytope Example

The blue polytope corresponds to the BAC.

The red polytope corresponds to the BAEC.

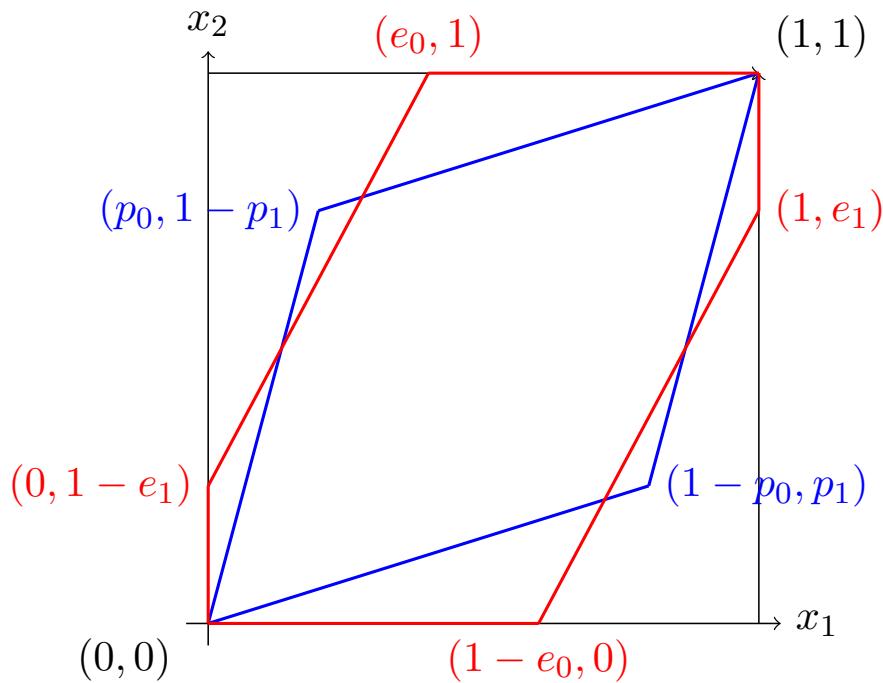

Since the blue polytope is **not** contained in the red polytope, the BAC channel is **not** a degradation of the BAEC channel.

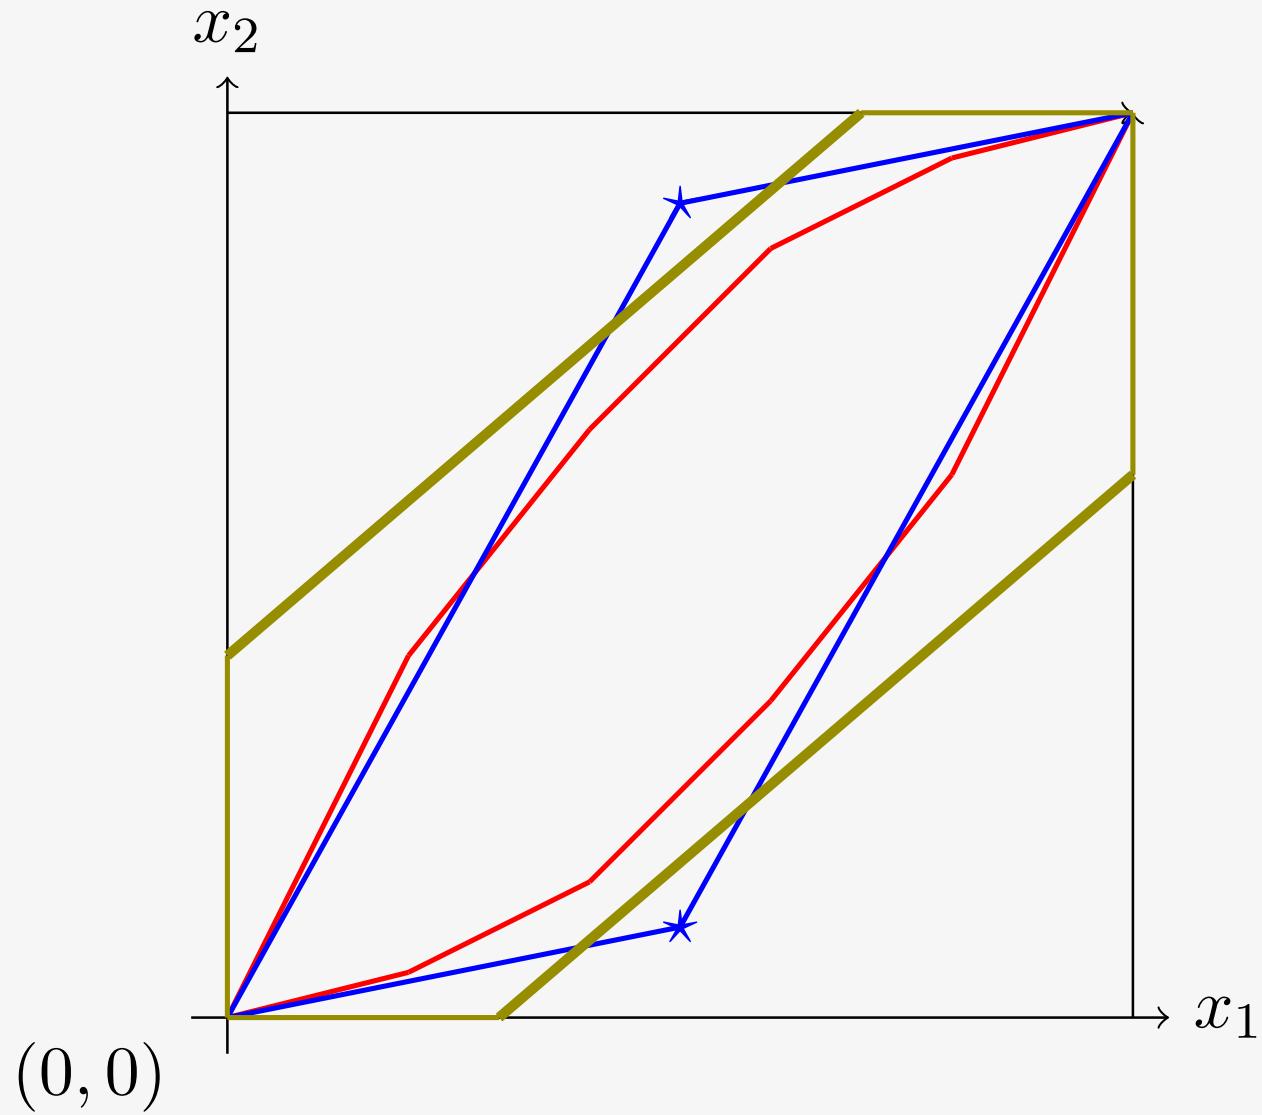

Binary Asymmetric Erasure Channel (BAEC)

$$\begin{bmatrix} 1 - p_0 & p_0 \\ p_1 & 1 - p_1 \end{bmatrix}$$

$$\begin{bmatrix} 1 - e_0 & 0 & e_0 \\ 0 & 1 - e_1 & e_1 \end{bmatrix}$$

Binary Asymmetric Channel (BAC)

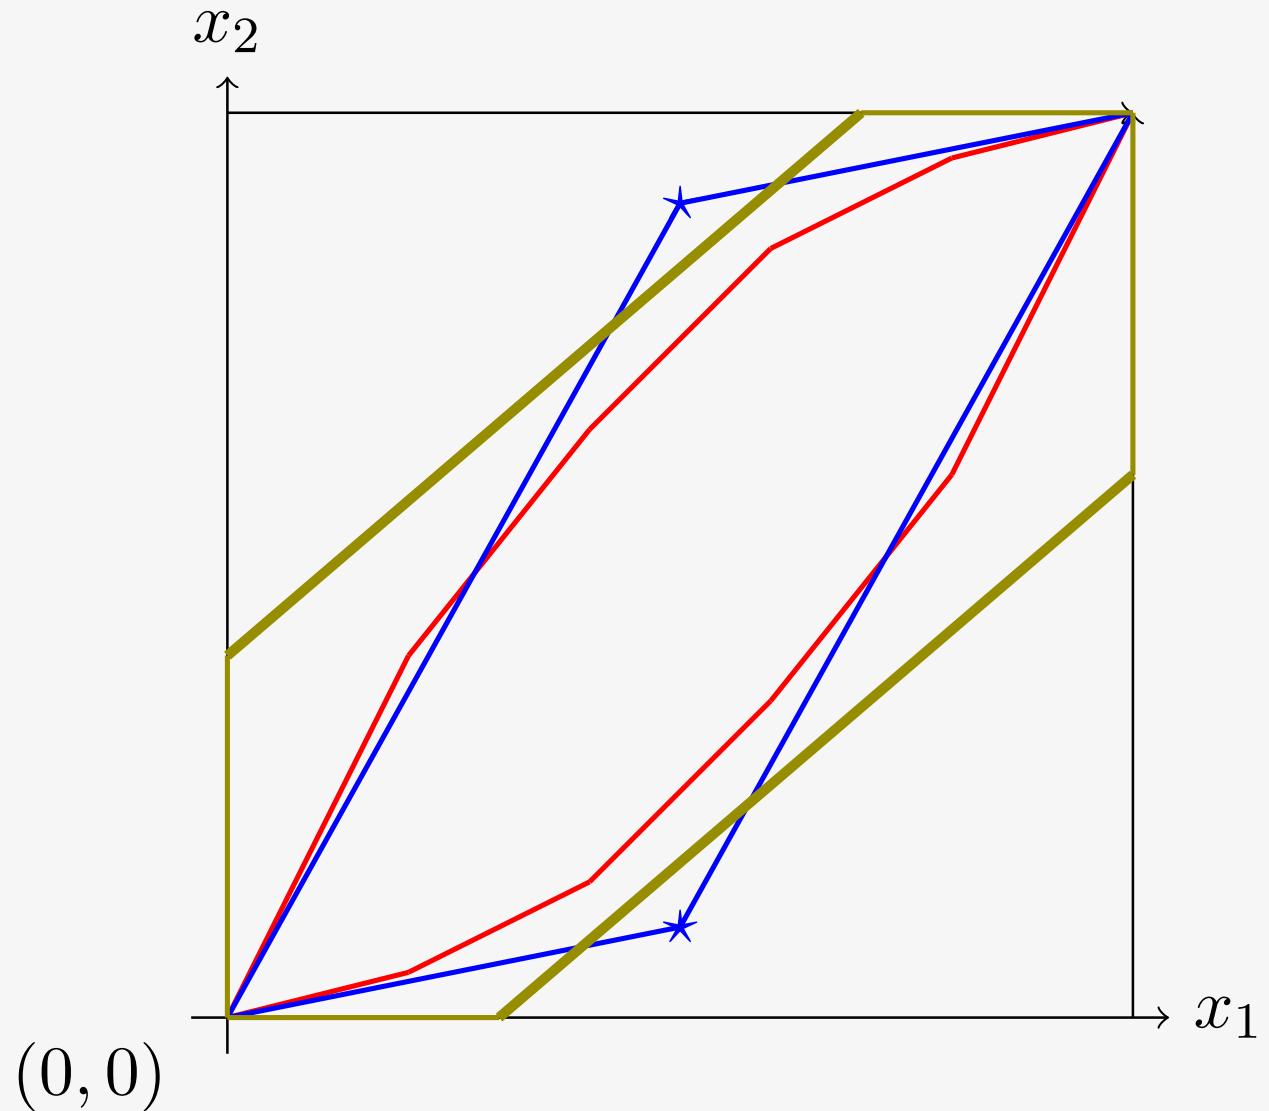

## Reducing Eve's Channel to a BAEC

The **blue polytope** corresponds to the **BAC**.

The **red polytope** corresponds to some channel **ChE**.

Since the **blue polytope** is **not** contained in the **red polytope**, the **BAC** channel is **not** a degradation of **ChE**.

## Reducing Eve's Channel to a BAEC

Apply the strict separating hyperplane theorem!

Take an extreme point of the BAC not inside the ChE polytope and separate it from the ChE polytope.

Olive polytope is a BAEC channel s.t. (1) ChE is a degradation and (2) ChB is not a degradation.

Can find this polytope efficiently.
